An Atlas of Population Patterns in Metropolitan Los Angeles and Orange Counties 1980 - 1990

Occasional Publications in Geography No. 8.

Los Angeles and Orange Counties encompass a region of over 11 million people -- the core of Southern California. Although for the last century they have been dominated by English-speaking whites, other groups have always lived here and played important roles in the region's development. Liberalization of America's immigration laws and the belief of many people that opportunities for economic advancement were greater here than in their home countries have resulted in a large influx of Asians, Pacific Islanders, Latin Americans, and others since the late 1960s. In addition, several groups of refugees have settled here. Because the non-Hispanic white population has declined during the 1980s while minority numbers have grown so rapidly, this core area is experiencing a major ethnic transformation.

The production of this book represents a significant change from the way that atlases have traditionally been created since it was produced entirely on a Macintosh II computer. None of the usual manual and photographic map production methods were used. The maps were produced with MapMaker, Canvas and Illustrator software; the digital files were converted to negatives on a Linotronics 330 Imagesetter.

U. S. census data. All maps are based on complete-count data from the U. S. censuses of 1980 and 1990. The PL 94-171 tape was used for 1990 and STF 1 was used for 1980. The data as mapped are comparable; the only revision necessary to make them comparable was

our addition of the Other Asian population data from the 1980 STF4 tape to the 1980 totals of Asian and Pacific Islander.

Topical coverage of the maps and design. This book portrays only the most basic ethnic populations: non-Hispanic whites, non-Hispanic blacks, Asian and Pacific Islanders, and people of Hispanic origin. The Other race category of census data was not mapped because 99 percent of this group was of Hispanic origin. American Indians were not mapped because their numbers were so much smaller than the other populations and their distribution was very even across the counties.

Map design. Maps are of two basic types. Choropleth maps portray the varying percentages of each ethnic group within the total inhabitants of each tract in 1990 as an indicator of the ethnic character of different areas. Colors were generally chosen to accentuate the high and low percentage areas because this identifies easily both strong ethnic concentrations or unusually weak representation within an area. Dot maps show, by two different colors, the numerical increase or decrease of each ethnic group in each tract between 1980 and 1990. Dot values represent either 100 or 150 individuals depending on the size of the ethnic population. In addition, there is a map of the relative ethnic diversity of each tract and a map of change in diversity between 1980 and 1990, which identifies areas that are becoming more ethnically diverse and those that are becoming more homogeneous.

Place names used in the text interpretation are often located on the maps, except where such a name would obscure major features of the map pattern. Selected portions of the freeway system are also shown to assist in orienting the reader. On choropleth maps the L. A. Downtown tracts between Temple, Main, and 9th Streets, and the Harbor Freeway are highlighted in magenta or black.

Class intervals on choropleth maps (percentage and diversity maps) were created by dividing the range of values into percentile groupings. Because the extremes of the range are generally of greater interest than the middle, they are delineated with a smaller percentile range and contain fewer tracts. On the White, Hispanic, Diversity and Diversity Change maps the highest 5 percent of the tracts are included in the top category. On the Asian and Black maps the highest 5 percent of tracts are covered by two categories. The lowest 10 percent of the tracts are included in the bottom category on the White, Hispanic, Diversity and Asian maps. The bottom category covers the lowest 5 percent of the tracts on the Diversity Change map and the lowest 25 percent of the tracts on the Black map. Class frequency numbers and bars in the legend for choropleth maps indicate the number of tracts which are included in each category.

Areal coverage of the maps. The maps show the largest, most densely populated portion of Southern California -- the area which contains the greatest ethnic diversity. Maps cover nearly all of Los Angeles County except areas north of the San Fernando Valley and west of Pacific Palisades. Orange County's less populated eastern parts are not shown.

Interpretative text. The commentary provides only brief introductions to the patterns and calls attention to some characteristics or trends of selected cities or smaller areas. This is because most localities have not been sufficiently studied and because explanation of the patterns

is difficult, involving the complex interplay through history of many influences. Such influences include variations from place to place in housing prices and environments, ethnic differences in economic resources and residential preferences, and the personal ties that attract newcomers to neighborhoods where friends and relatives have already settled. In addition, other factors such as earlier racial discrimination in housing, locational decisions of businesses in response to the increasingly internationalized economy, and government decisions regarding zoning and urban renewal may be very significant in some places. Hopefully, these maps will prompt Southern Californians to investigate and understand their local areas more fully.

Data unadjusted for undercount. These data have not been adjusted to correct a likely undercount of some populations. The U. S. Department of Commerce will decide by July 15, 1991, if the data from the 1990 census should be adjusted. Preliminary indications are that the undercount of blacks and Hispanics was somewhat greater than in 1980. The basic patterns on the maps will not change if a decision is made to adjust the original figures. This is because the undercount represents only a few percentage points. In addition, population change is portrayed consistently on our maps in that the original census counts without adjustment are used for both 1980 and 1990.

Adjustment due to separate race and Hispanic-origin data. Individuals completing the census questionnaires were asked in one question (#4) to identify their own race and, in another (#7), whether or not their origin is Spanish/Hispanic. Thus people of Hispanic origin can be of any race. The maps show non-Hispanic whites and non-Hispanic blacks. In contrast, the total counts of Asian and Pacific Islanders and Hispanics were used. Although 1.3 percent of Hispanics in Los Angeles County identified themselves as also Asian or Pacific Islander (mostly Filipinos and Guamanians), these individuals were not subtracted from the Hispanic numbers because no comparable tract-level tabulation was available for 1980.

Census tract boundaries. The small areal units shown are census tracts as identified for the 1980 census. Boundaries were located by Strategic Mapping, Inc. in San Jose, CA. Many tracts and boundaries were changed for the 1990 census. The California State Data Center in Sacramento provided a list that identified the 1990 tracts that were approximately equivalent to those in 1980. In some cases the data for adjacent tracts were aggregated so that the tracted area for the two censuses was equivalent. For the 1980 - 1990 change maps these aggregated totals were reallocated to the 1980 tracts based on tract areas. For the percentage choropleth maps the aggregated value was assigned to all tracts in an aggregation, creating a single, larger tract.

Acknowledgements. Production of this book was made possible by a grant from the School of Social and Behavioral Sciences, California State University, Northridge.

Copies of this book may be obtained by sending a \$10.00 check (no purchase orders) payable to the CSUN TRUST FUND to the Center for Geographical Studies, Department of Geography, California State University, Northridge, Northridge, CA 91330. Individual map pages (folded) are available at \$3.00 per page or \$5.00 for two pages. © 1991 by CSUN Dept. of Geography.

White Population Change

Metropolitan Los Angeles and Orange Counties
1980 - 1990

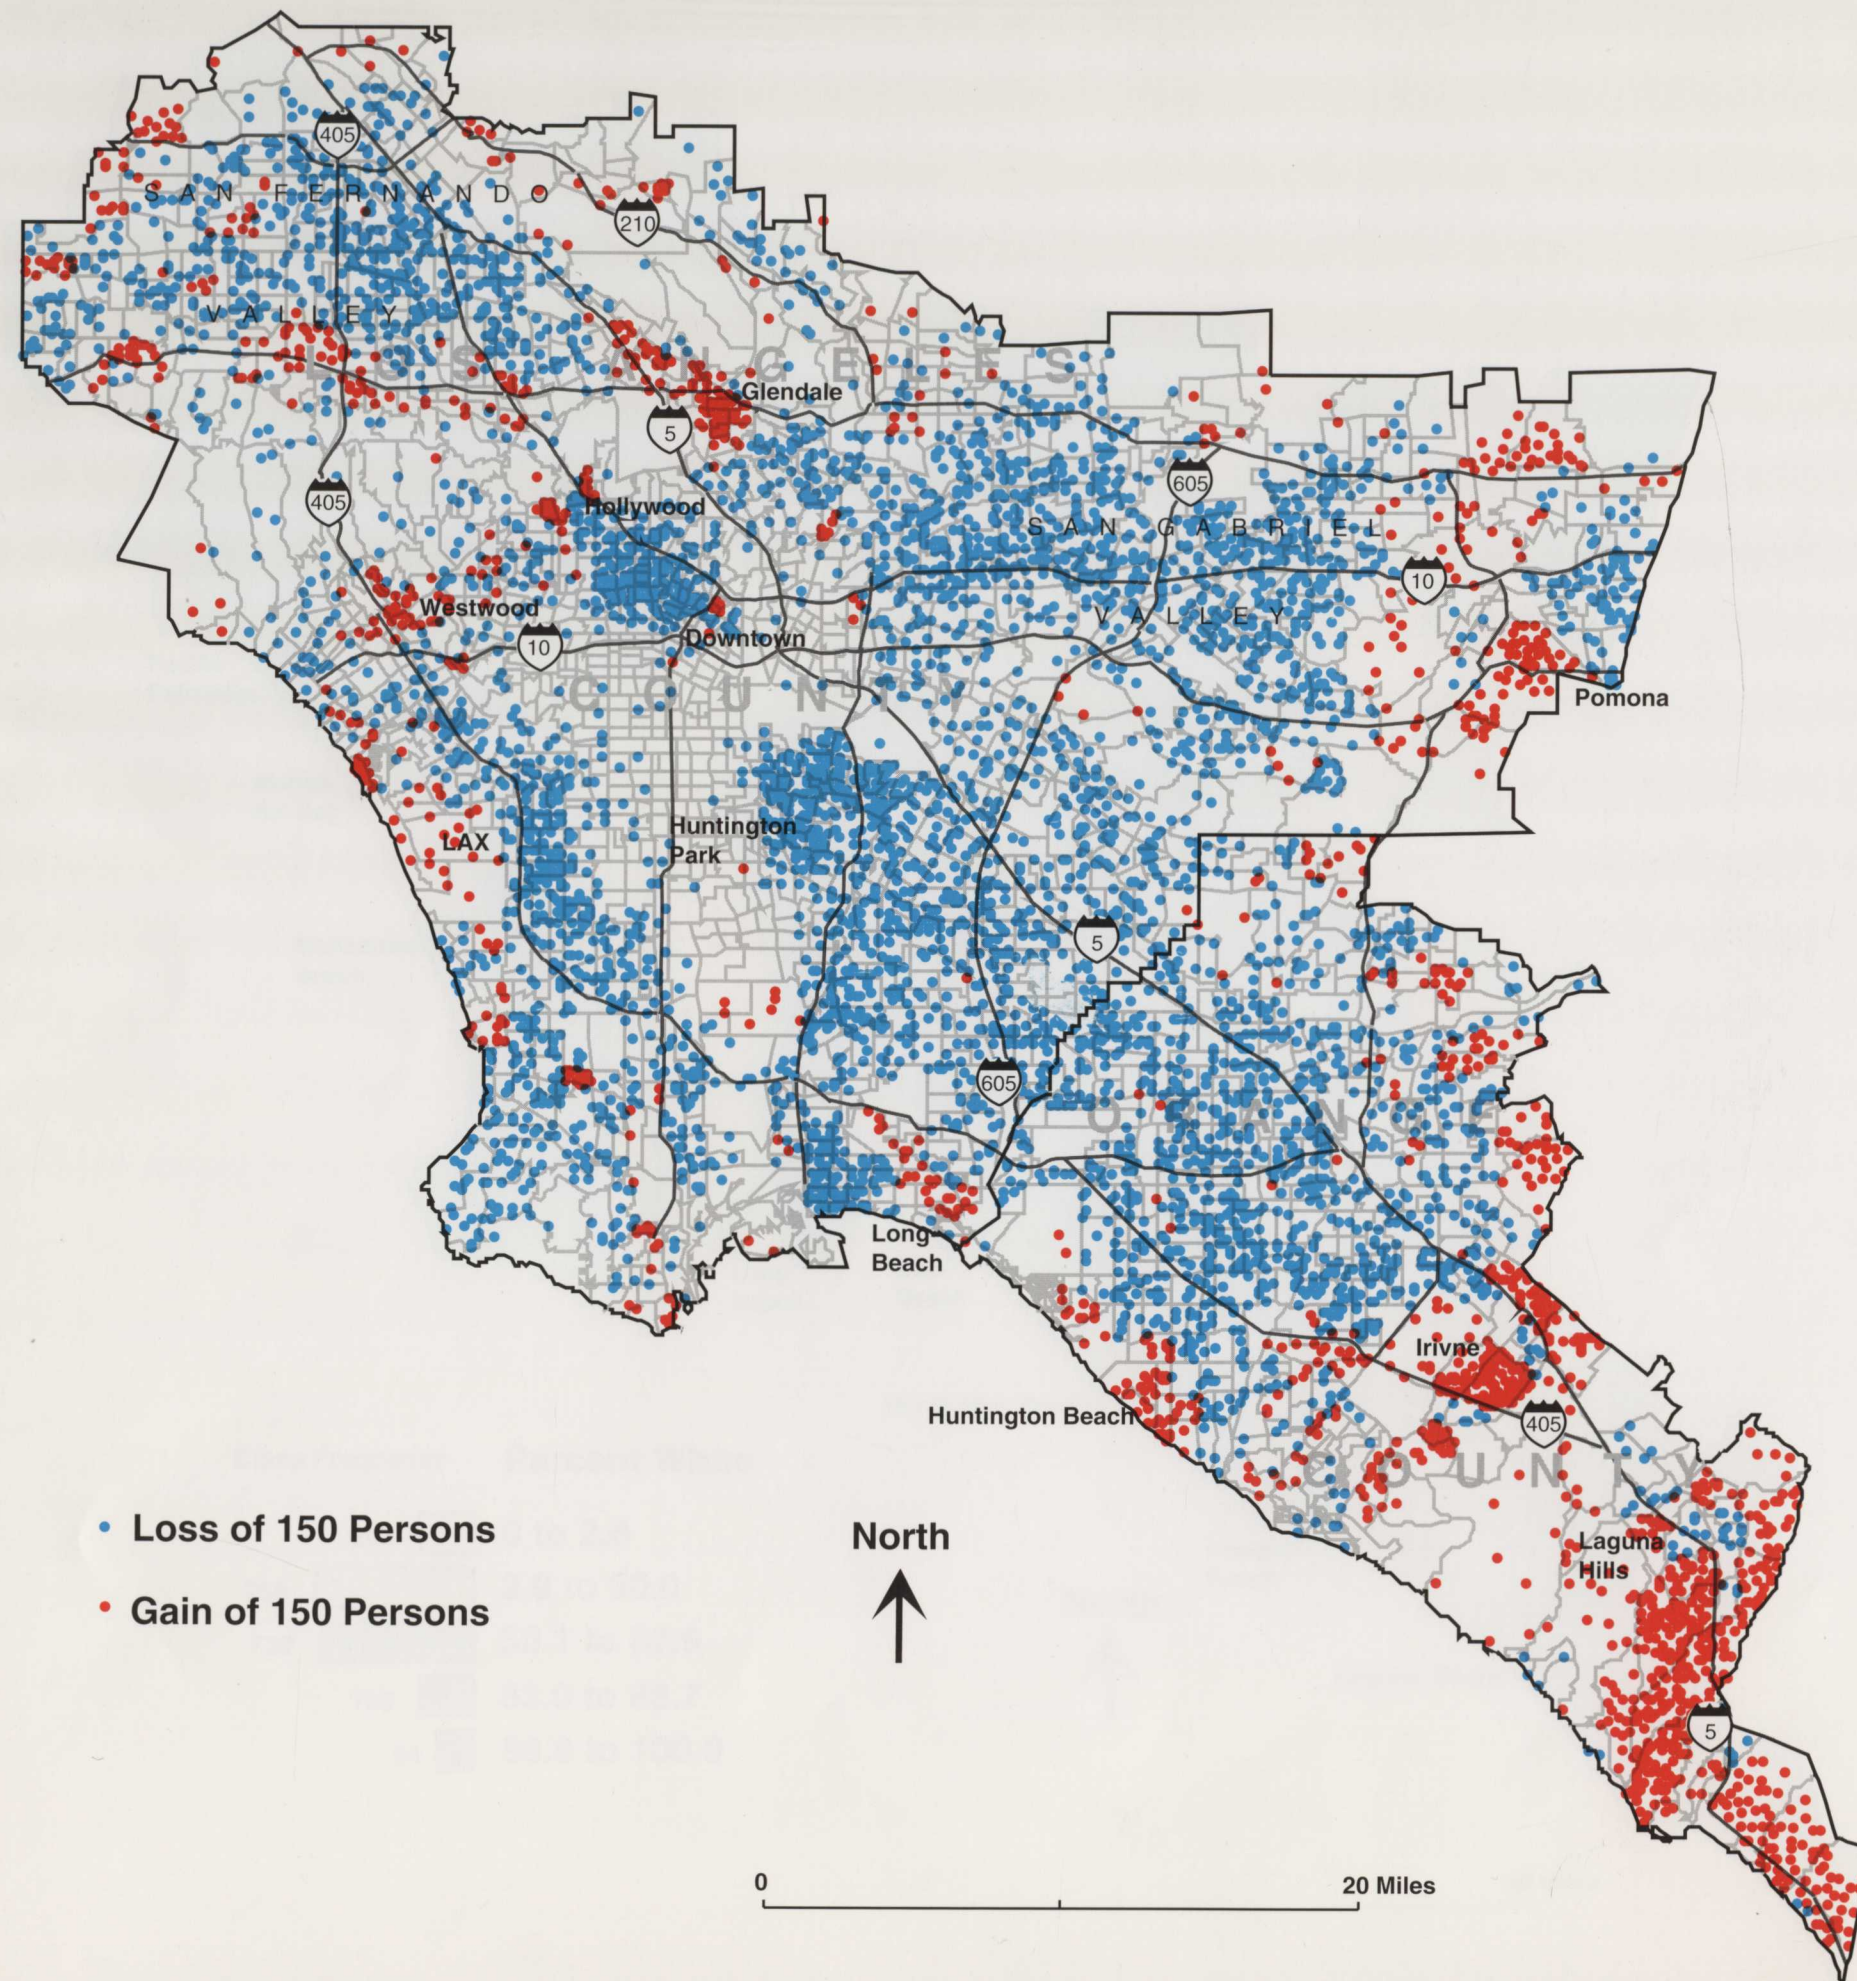

The non-Hispanic white (sometimes called "Anglo") population of Los Angeles County declined by over 330,000 during the 1980s; the same group in Orange County increased by only 44,000 -- less than 3 percent. Out-migration, particularly from Los Angeles to other Southern California counties, plus a low birth rate and high average age explain the fact that whites are the only ethnic group of those mapped which is shrinking in numbers.

Because white decline was so widespread, it may be more illuminating to examine the areas which experienced an increase in whites. In general, white populations grew where there were either (1) new middle- and upper-income housing developments or (2) recent Soviet or Iranian immigrant or refugee concentrations.

As in previous decades, new homes were most commonly built on the fringes of the already built up areas. In Orange County the southward development of earlier decades continued. Suburbanization, led by both condominiums and single-family homes, transformed hills and valleys and the more expensive near-coast zones into the new cities of Laguna Niguel, Laguna Hills, Lake Forest (formerly El Toro), Mission Viejo, and Dana Point. Suburbanization was also widespread in the eastern San Gabriel Valley area, particularly in La Verne, in parts of Pomona, and in Diamond Bar.

The second reason for white population increase in certain places is the arrival of white immigrants and refugees, primarily from Iran and the Soviet Union. Most of the white growth in parts of Hollywood is due to the influx of Soviet Jews and Soviet Armenians, just as Iranian settlement in Westwood has increased that area's white population. Similarly, Iranians, including many Jews, and Jews from the Soviet Union have settled in the southern portion of the San Fernando Valley. The southern part of the city of Glendale appears on the map as an especially important center of increasing white population. That area represents a step up for Armenians who arrived first in Hollywood and is perhaps the major focus of the growing Armenian population, particularly of those from Iran.

Percent White Population

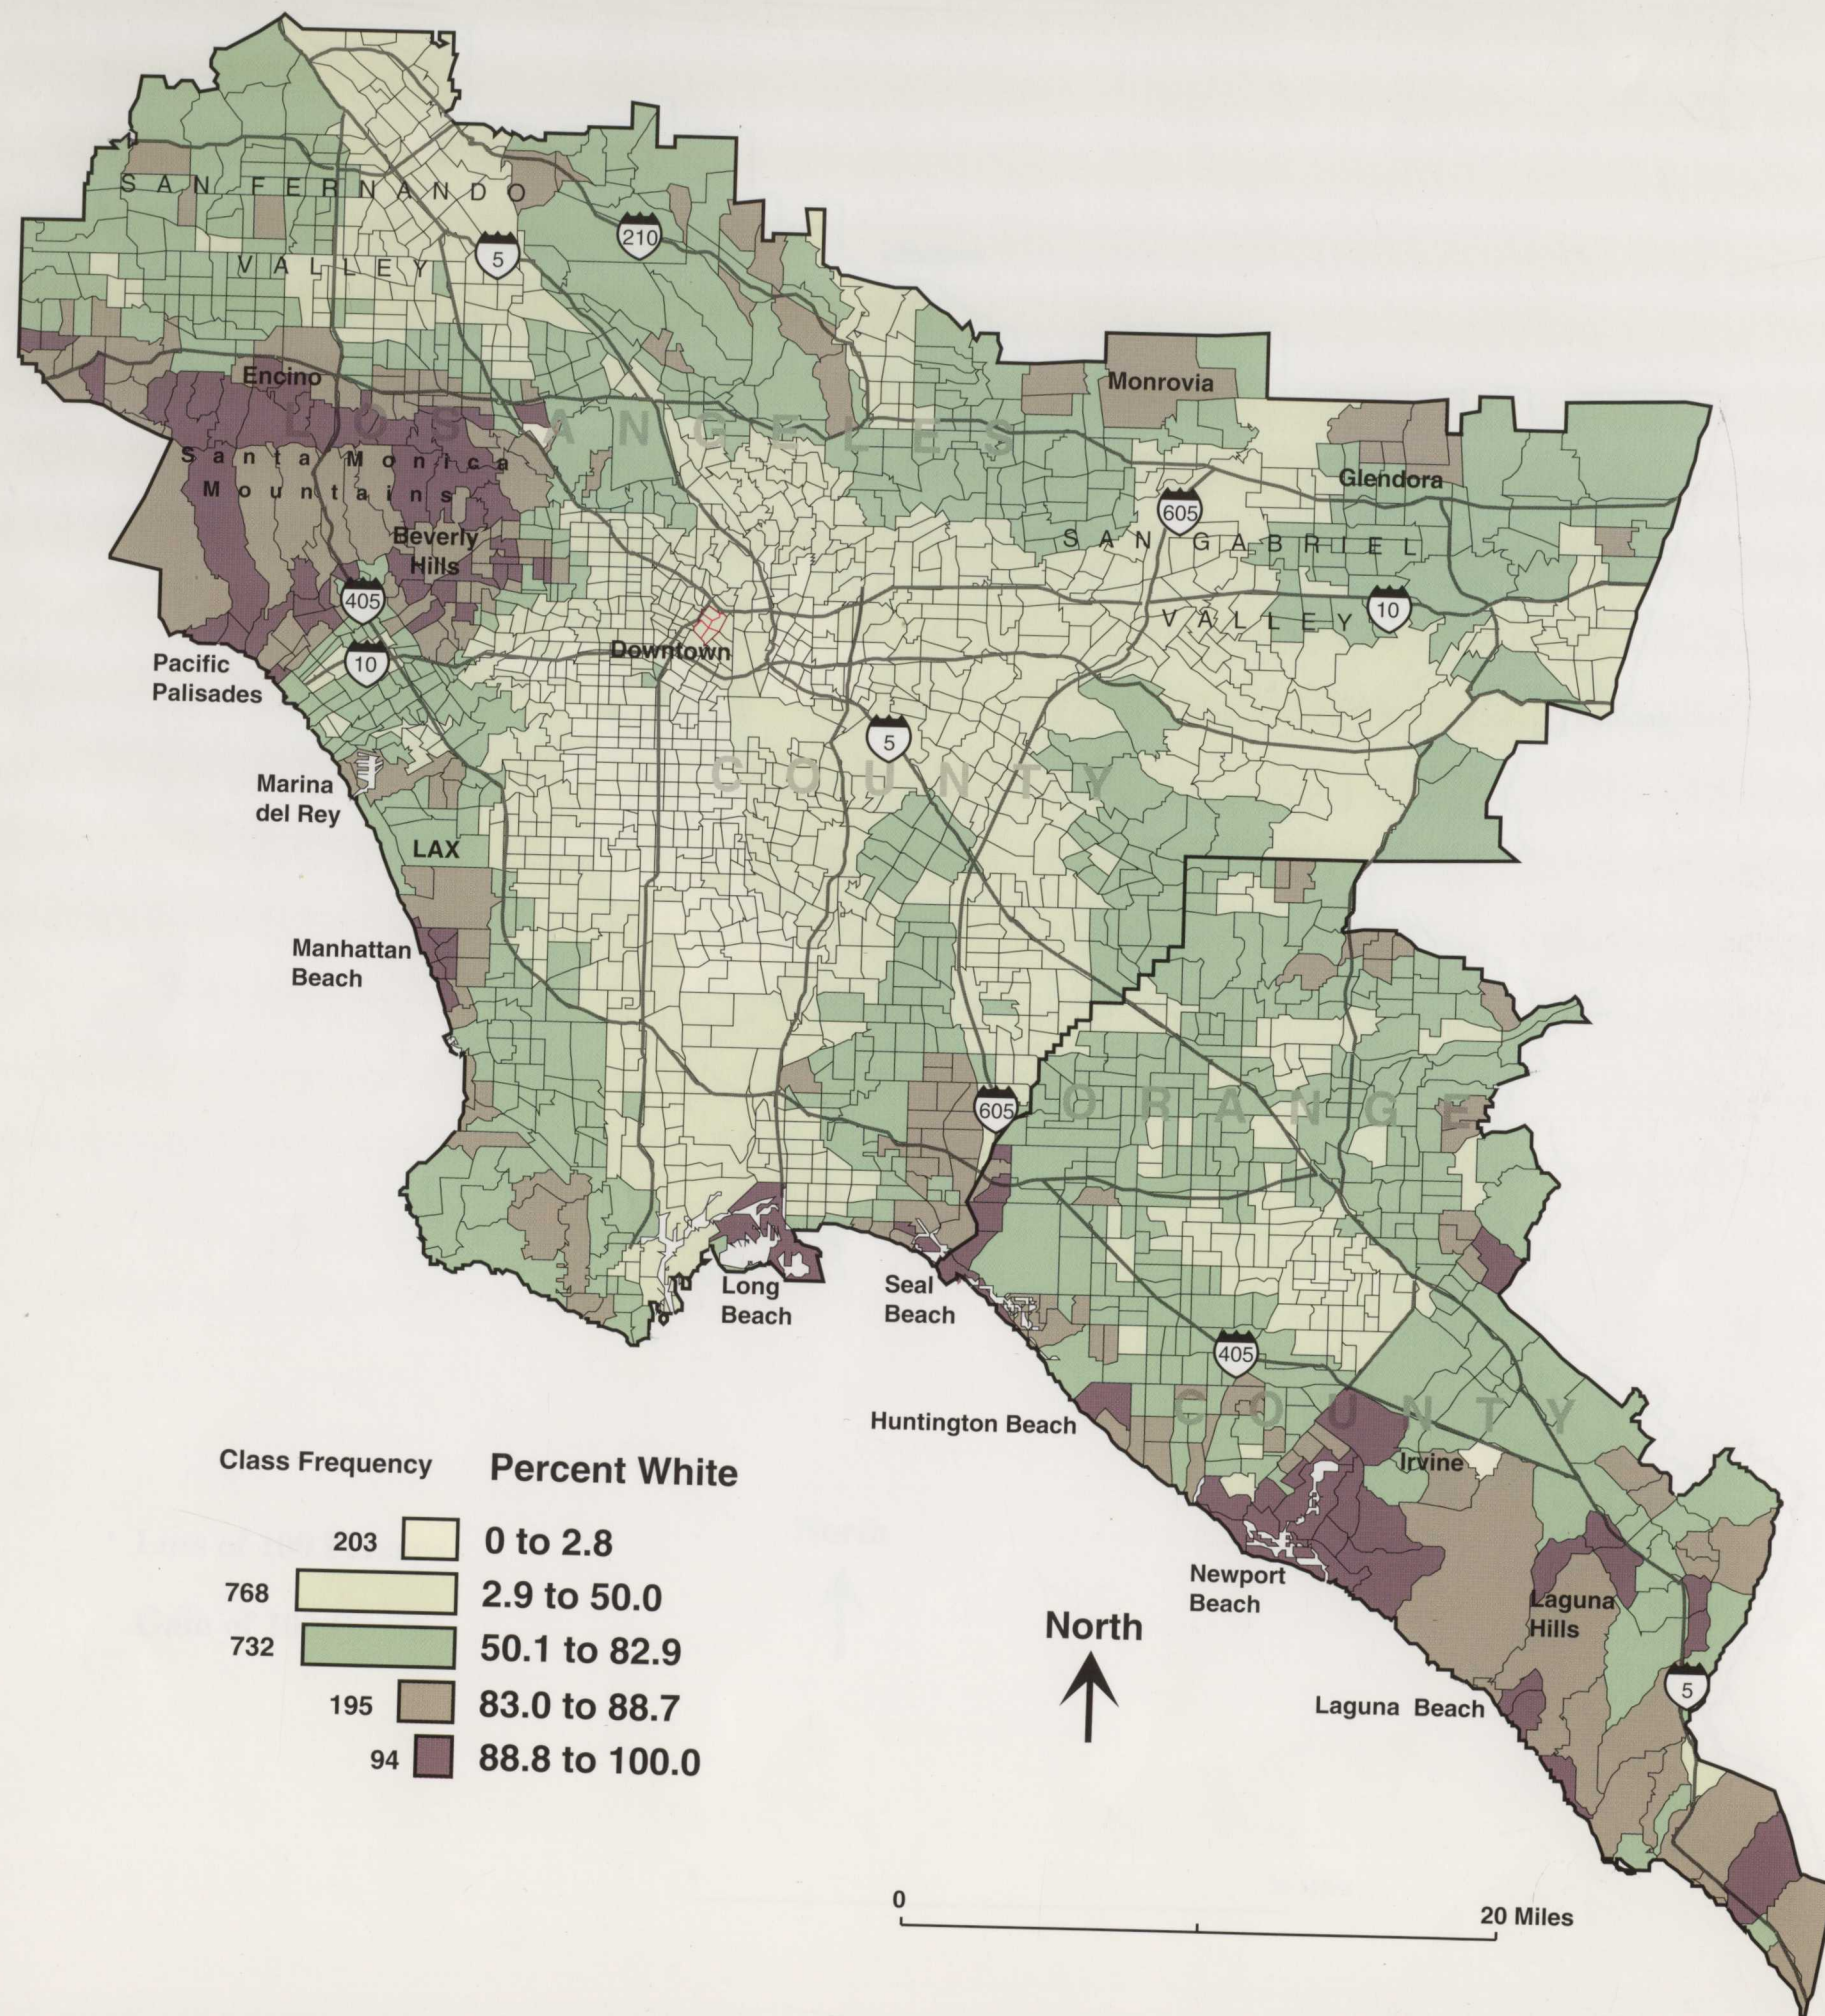

Metropolitan Los Angeles and Orange Counties
1990

The map shows a clear pattern of the more central, older areas having relatively few non-Hispanic whites. The areas with the lowest percentage of whites are areas with very large minority populations -- the Mexican area of Boyle Heights and East Los Angeles and the large black concentration of South Central Los Angeles.

In direct contrast, areas of recently built suburbs or especially expensive homes, often on view lots, tend to have the highest percentages of whites. For example, in the southern San Fernando Valley, whites are particularly predominant on the slopes of the Santa Monica Mountains and nearby valley areas, from Encino east to Studio City and Toluca Lake. A similar pattern appears in the hills above Hollywood and Beverly Hills, from Coldwater Canyon through Beverly Glen. Closer to the coast, Pacific Palisades and Brentwood show up as more white than adjacent Santa Monica. To the south of LAX the higher percentages of whites are evident in high-status Manhattan Beach, perhaps in part a remnant of the 1920s when black property owners were forced out of that city.

The map is misleading in showing such a high proportion of whites in the port area of Long Beach because that entire area represents just one tract where only 27 people live: it is a zone of shipping and warehousing -- of docks, heavy cranes, and storage for thousands of containers and automobiles from overseas.

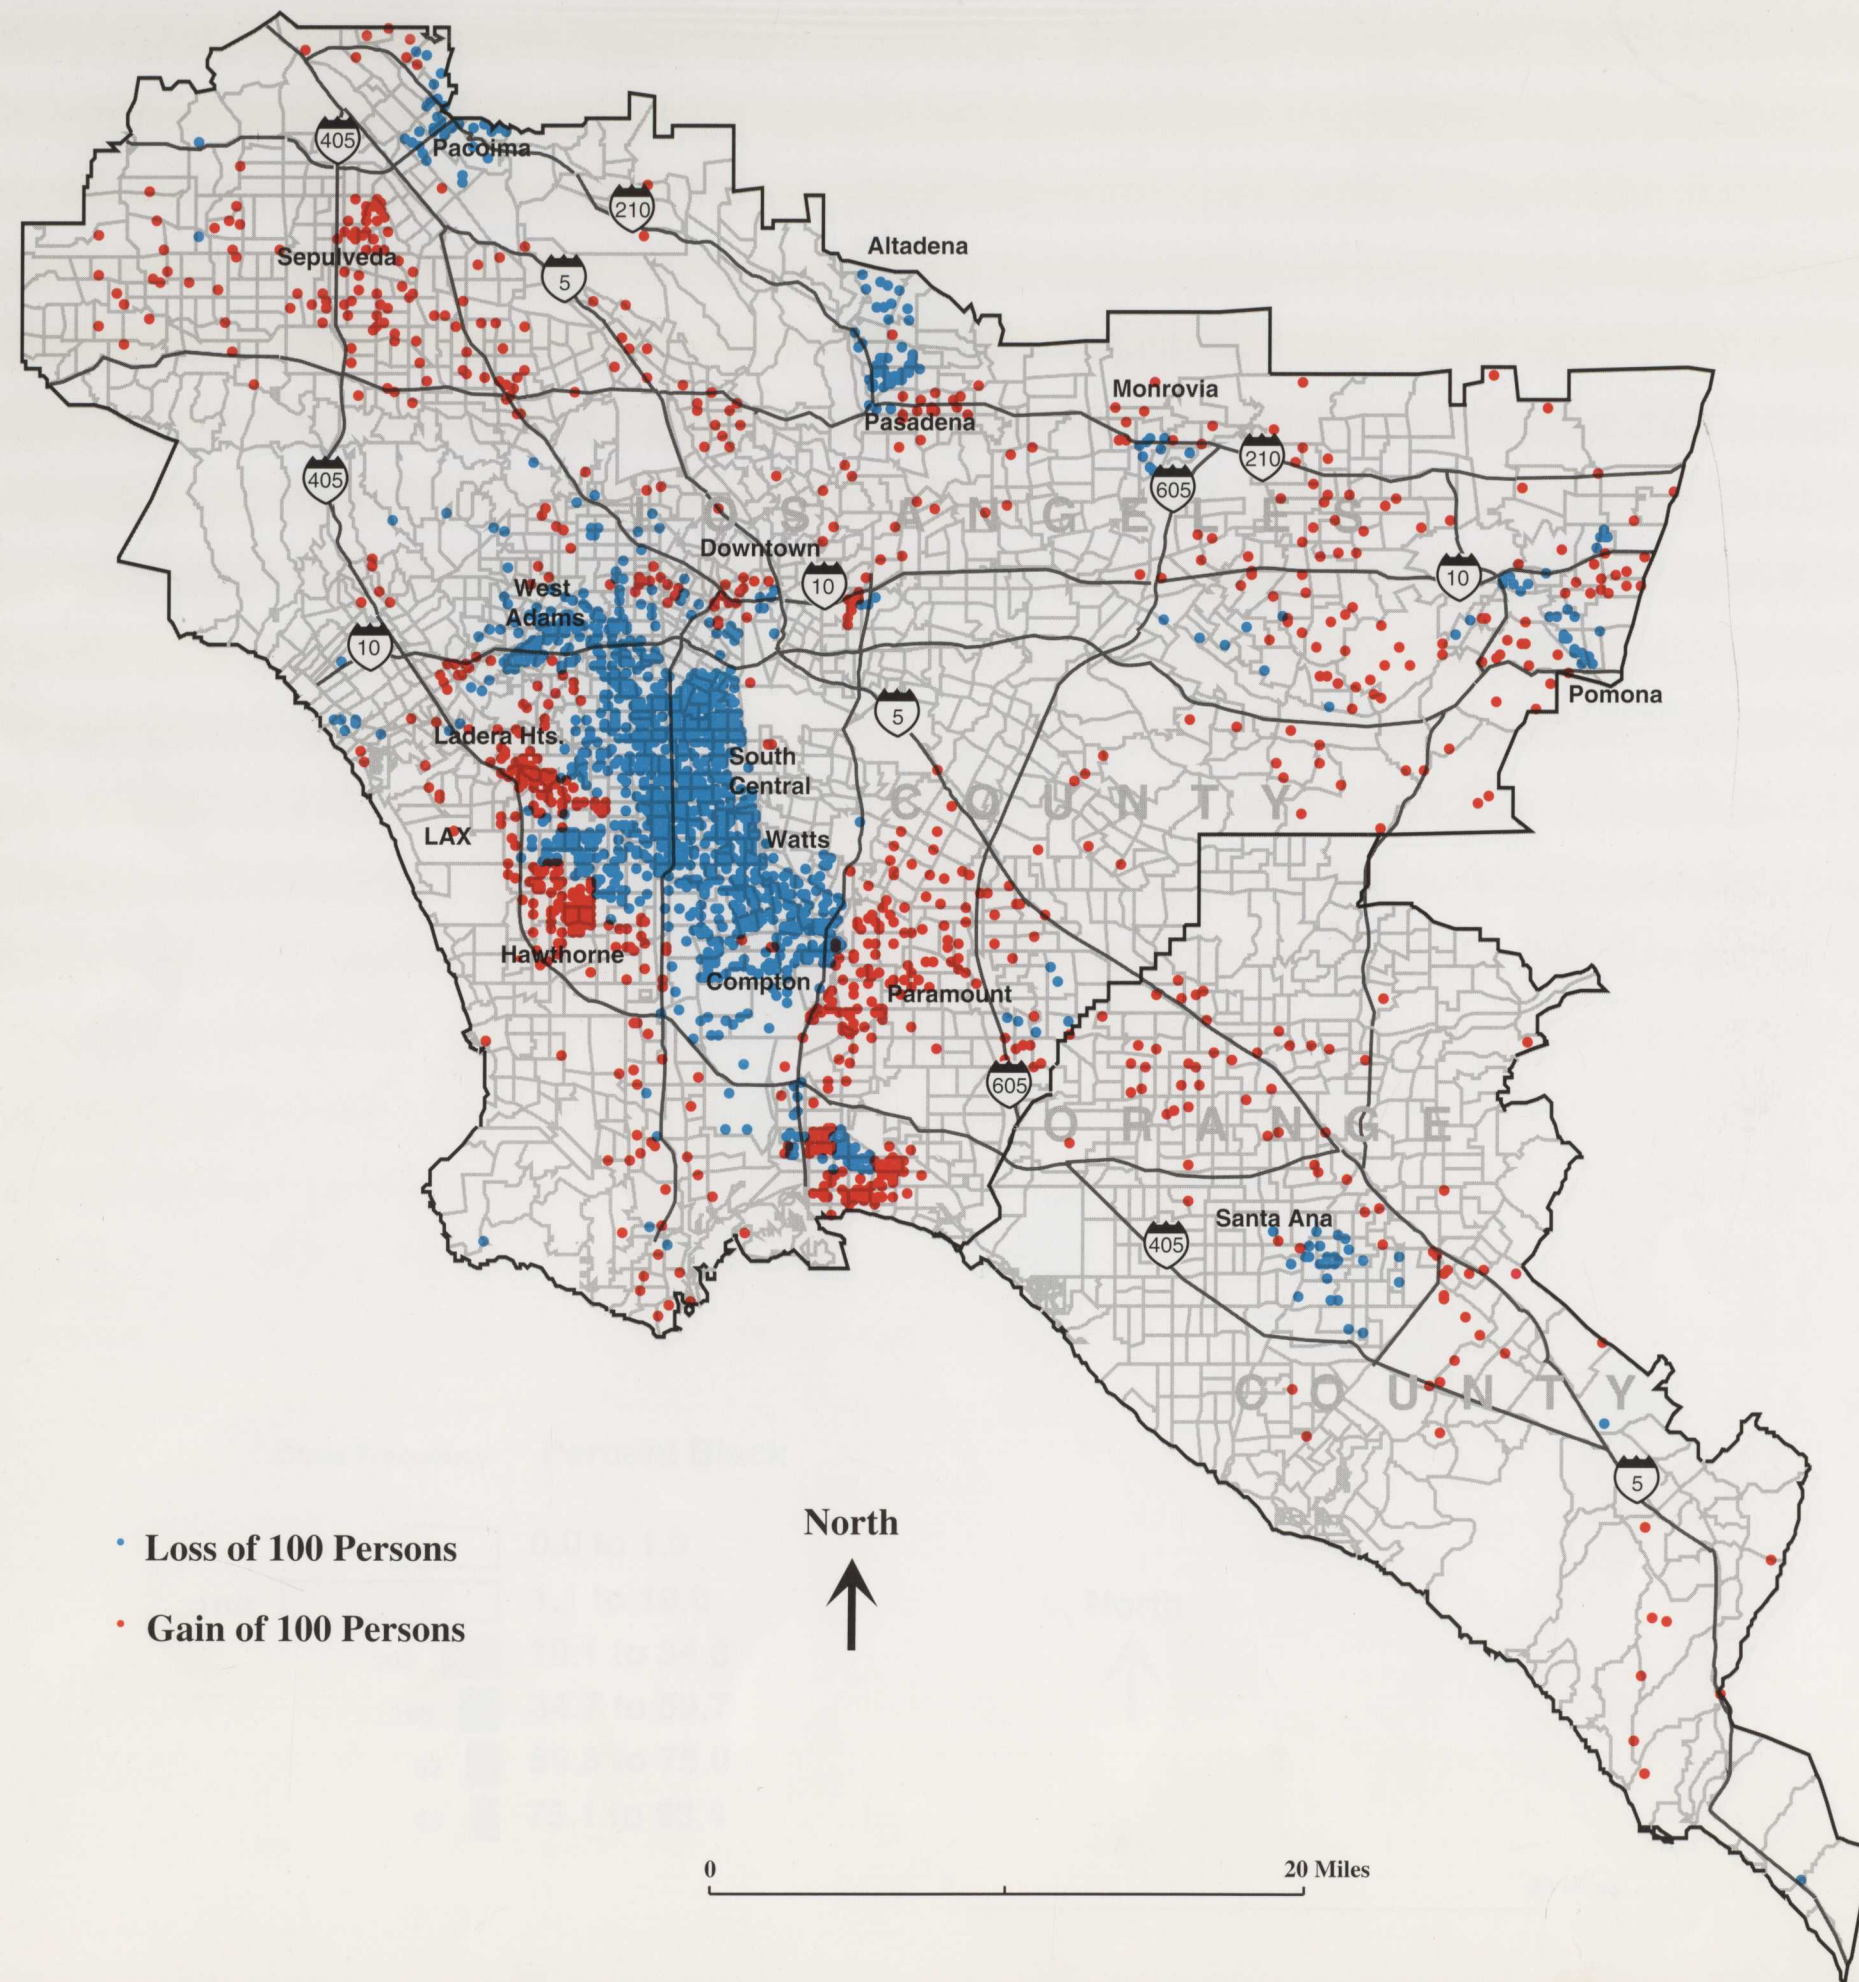

In Orange County several sections stand out as having unusually high percentages of non-Hispanic whites. Along the coast are the more expensive view areas of Huntington Beach and Laguna Beach. Newport Beach -- easily the wealthiest city in Orange County -- contrasts sharply with much more diverse Costa Mesa to its north. Moreover, Orange County contains the two tracts with the highest percentage of whites in either county. Each is over 95 percent white. The first is quite an unusual area -- the retirement center of Leisure World in Seal Beach, two miles from the coast, where 95 percent of the residents, at least in 1980, were over 60 years or age. The second area is part of the Laguna Hills development in the southern part of the county between the Golf Club and Interstate 5.

Black Population Change

Metropolitan Los Angeles and Orange Counties
1980 - 1990

Most evident from this map is the deconcentration of black (or African-American) settlement during the 1980s. Areas which declined in black population were areas which in 1980 had notably high proportions of blacks. People of Hispanic origin, usually from Mexico or Central America, expanded their own settlement area from the east into the areas left by the departing blacks. This appears to represent a filtering down of housing to a recently arrived, poor immigrant group -- a process of ethnic neighborhood succession that has been common in American cities over the last century.

The black population grew most in areas surrounding this major concentration, especially toward the west and the southeast. Indicative of this is the major expansion westward into Hawthorne, where the proportion of blacks doubled during the 1980s (to 28 percent in 1990). Similarly, to the southeast of the ghetto, the city of Paramount changed from 3 percent black in 1980 to 11 percent black in 1990. In general, deconcentration brought those blacks who could afford to make the move into areas of better housing. Much less common were locally increasing black concentrations, as in the Sepulveda-Panorama City area of the San Fernando Valley, where both blacks and Latinos have crowded into neighborhoods which have grown by 70 percent since 1980.

Localized deconcentration also took place around outlying or suburban black concentrations, such as in Pacoima, Pasadena, Monrovia, Pomona, and in the section of Long Beach adjacent to Signal Hill. Widely scattered dots showing increasing numbers of blacks in the San Gabriel Valley and Orange County represent suburbanization into areas without previously black settlement concentrations.

Many blacks who left areas of concentration moved out of Los Angeles County, either to surrounding counties like Orange or to other states. Thus, the number of blacks in Orange County increased 62 percent during the eighties. At the same time, part of the black population increase portrayed on this map represents new arrivals from other parts of the U. S. plus immigrants from such countries as Belize and Jamaica.

California State University, Northridge

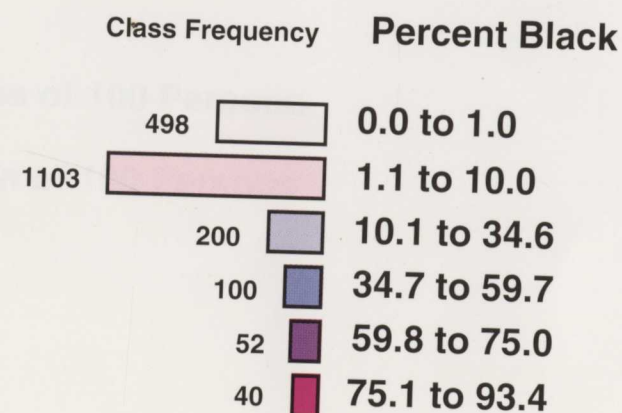

Percent Black Population

Metropolitan Los Angeles and Orange Counties
1990

For over a half century most blacks (or African Americans) in Los Angeles have lived in the largest black settlement concentration, often called South Central. The rapid growth of Los Angeles' black population in the period after 1915 and the later widespread restriction on black settlement in surrounding localities resulted in a crowded and segregated ghetto. Despite opposition by whites, black settlement expanded contiguously during some decades, particularly southward and westward. By 1980 this black ghetto extended southward from near Downtown for 15 miles through Watts and beyond Compton. On the western and northern fringes of this concentration were some areas of higher status, such as West Adams and Baldwin Hills.

During the 1980s the black population of Los Angeles County grew more slowly than in previous decades, as more blacks moved out of the county than moved in. Within the county, blacks who moved out of the main ghetto usually found their places taken by much larger numbers of Hispanics, especially on the northern, eastern, and central portions of the ghetto. For instance, in West Adams there was a small decline in blacks but a large increase in Latinos. As a result of Latino in-movement, blacks in 1990 comprised only about half the population in the South Central and Southeast sections, whereas black proportions were generally higher toward the west. For example, blacks in Compton constituted 75 percent of the residents in 1980 but only 55 percent in 1990. However, in the unusual racially mixed, wealthier enclave of Ladera Heights in the Baldwin Hills the opposite occurred: that area became more black as whites departed and blacks increased over 40 percent.

Suburban or outlying black enclaves -- Pacoima, Altadena and Pasadena, Monrovia, Pomona, Long Beach, and Orange County -- became less concentrated in the 1980s. For example, in 1970 two-thirds of the blacks in Orange County lived in the city of Santa Ana, a suburban ghetto. By 1990, Santa Ana contained only 18 percent of the more than 42,000 blacks in the county, and these constituted less than 3 percent of the city's population. The only Orange County tracts that are over 10 percent black are three military installations.

0 20 Miles

Asian Population Change

Metropolitan Los Angeles and Orange Counties 1980 - 1990

Immigrants and refugees from many Asian and Pacific Island countries swelled the Asian population in the 1980s, more than doubling their numbers in both Los Angeles and Orange counties.

The fairly even distribution of dots on the map shows that Asian growth was widespread, a result of the range of economic resources among Asians and the ethnic diversity contained within the Asian grouping. There was some degree of clustering of Asian growth, however, usually in areas where Asians had been concentrated before 1980. Koreatown, the western San Gabriel Valley cities, and Cerritos had major Asian increases. Asians also expanded into the area northeast of Chinatown, from Lincoln Heights to Eagle Rock, and into south Glendale. Since most of the Cambodians in Long Beach arrived after the 1980 census was taken, their concentration focused on Anaheim Blvd. stands out. To the south of Long Beach, most of the dots in the Santa Ana and Westminster area (Little Saigon) of Orange County represent Vietnamese who either came as refugees or migrated in from other states during the 1980s.

The number of Asians decreased in only a few areas. Most typical were older ethnically mixed neighborhoods, some of whose Asian residents died or relocated. The historic Japanese communities in the Jefferson-Crenshaw and Boyle Heights areas continued to lose people as they had in earlier decades, their places often taken by blacks or Latinos.

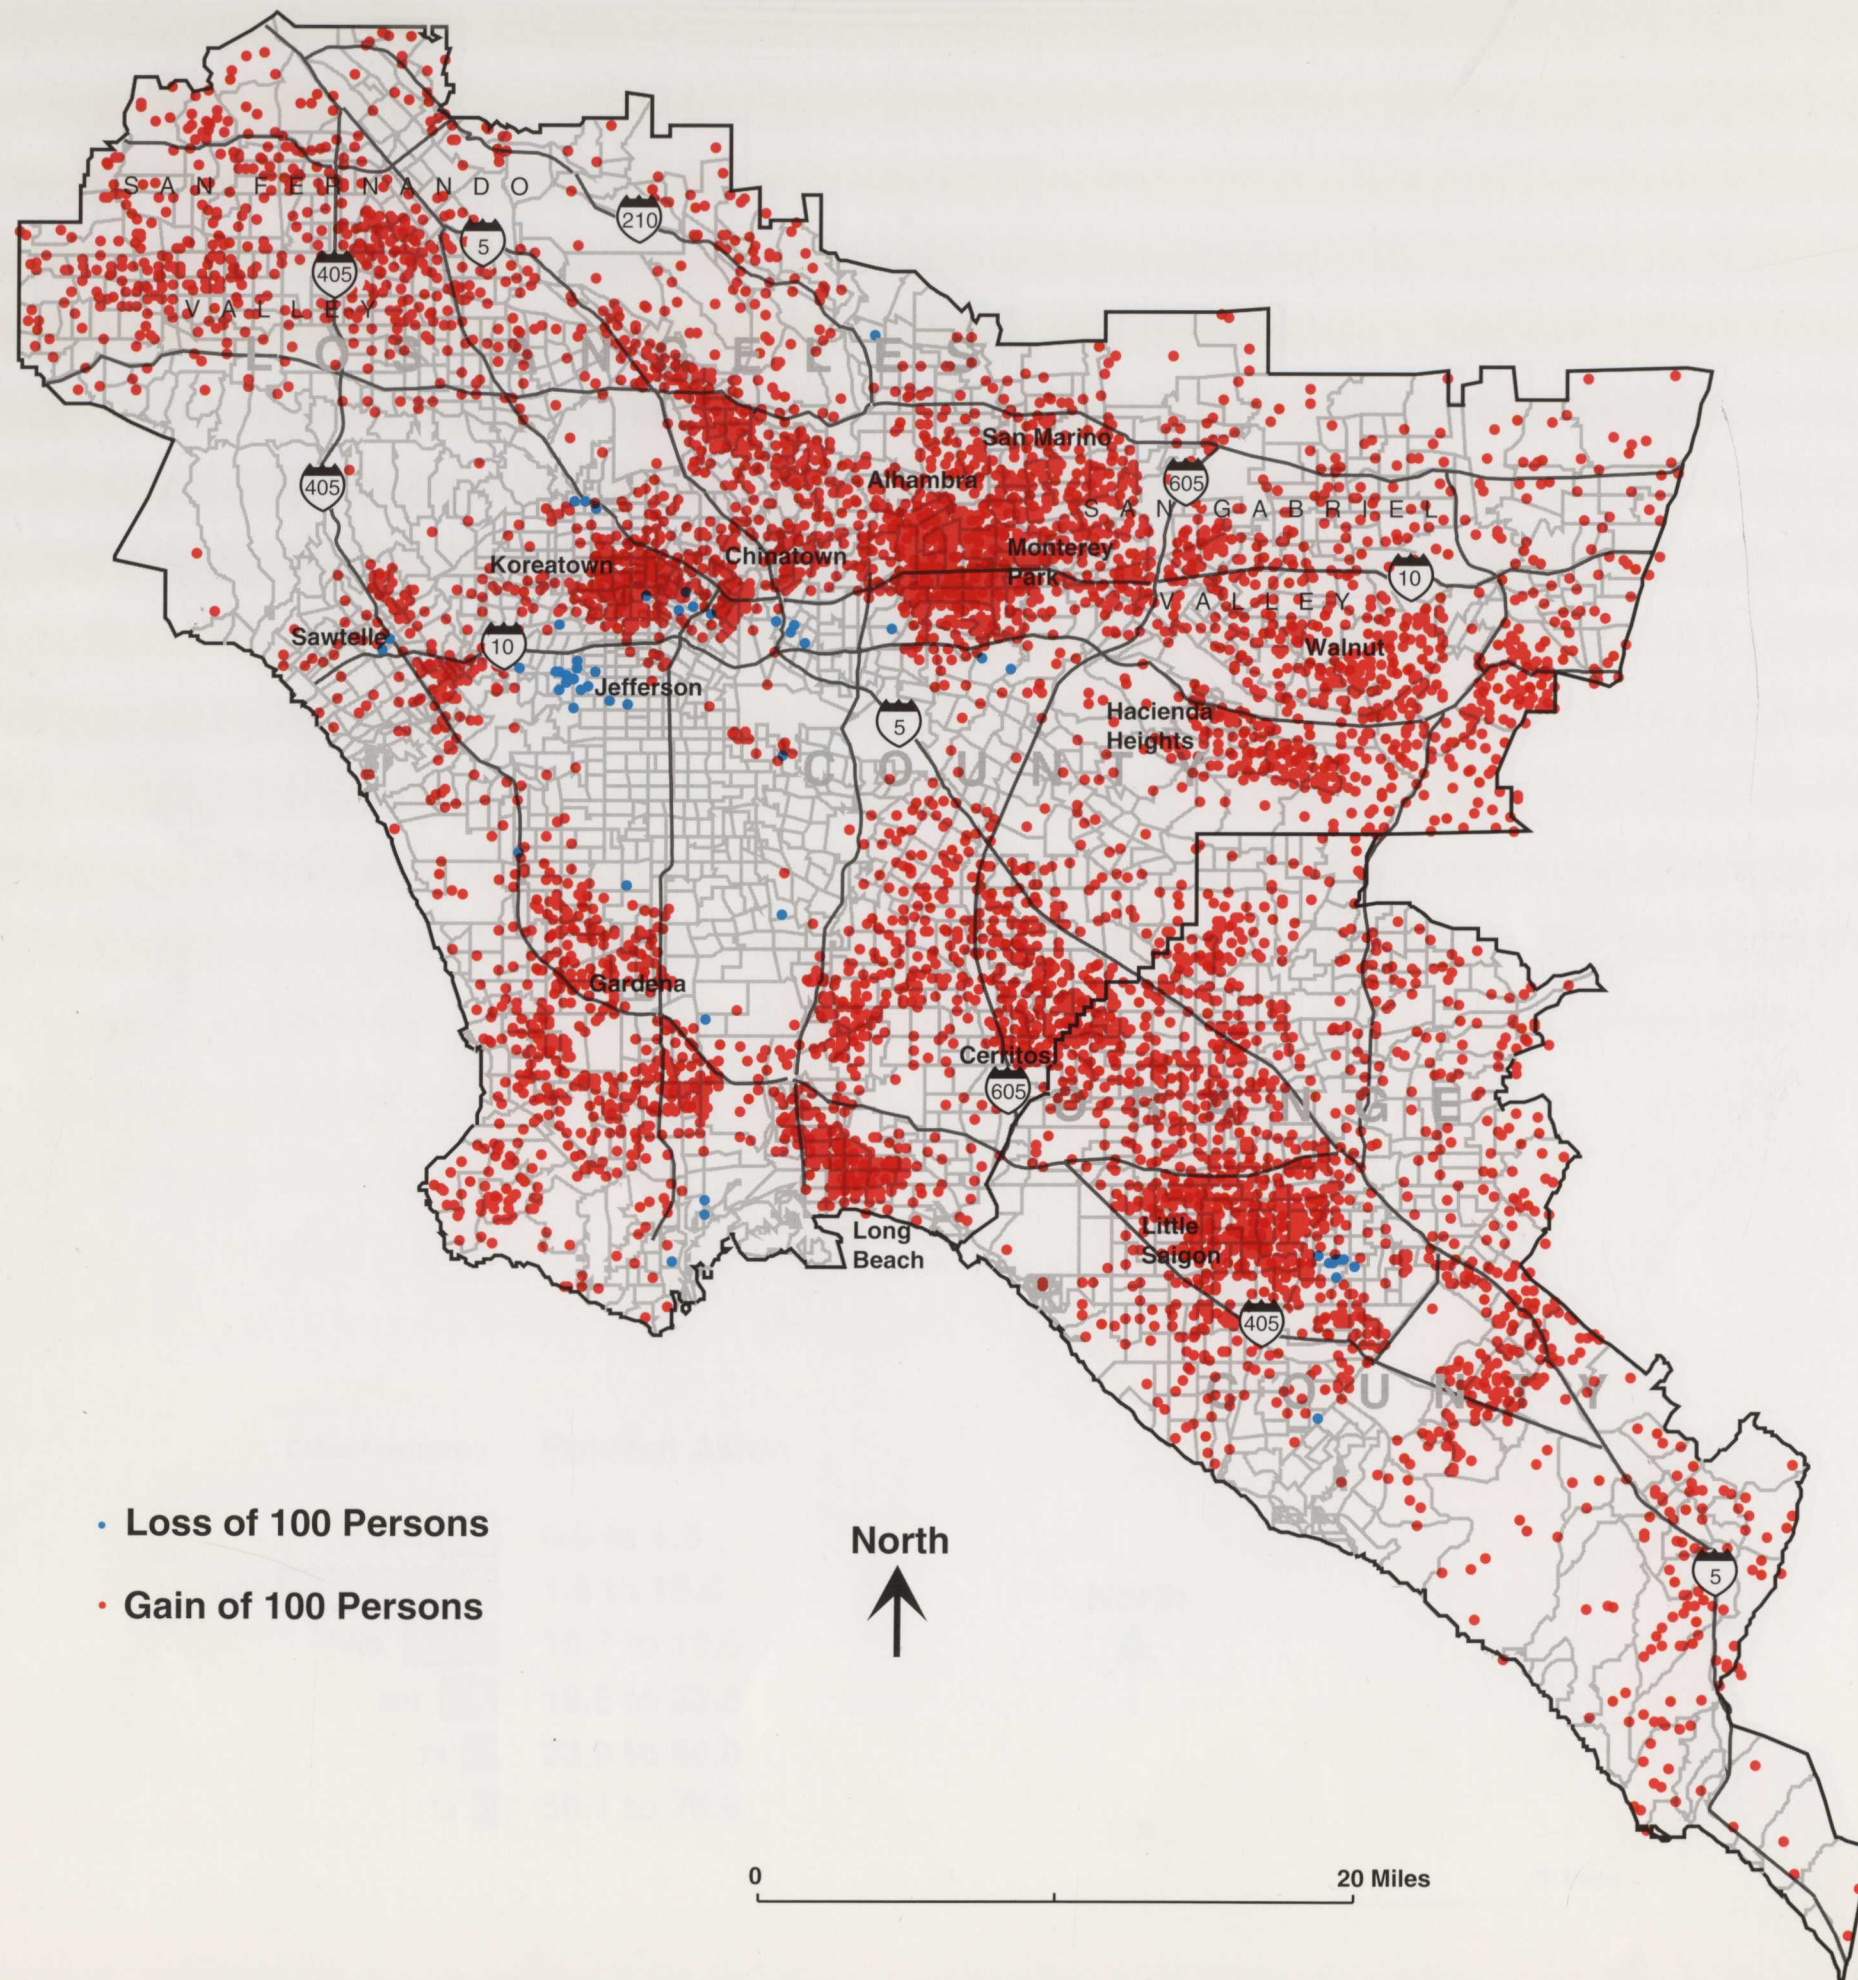

There were two tracts with precipitous declines of Asian numbers: one in Koreatown and the other in Santa Ana in Orange County. Because both tracts in 1980 had contained many Vietnamese refugees, declines may have been caused by refugees relocating in their effort to find affordable housing or be closer to jobs or relatives.

Few Asians have moved into the typically expensive coastal communities which have been so strongly favored by some whites. However, Asians have increased on the elite Palos Verdes Peninsula, where Rancho Palos Verdes is now 20 percent Asian.

Percent Asian Population

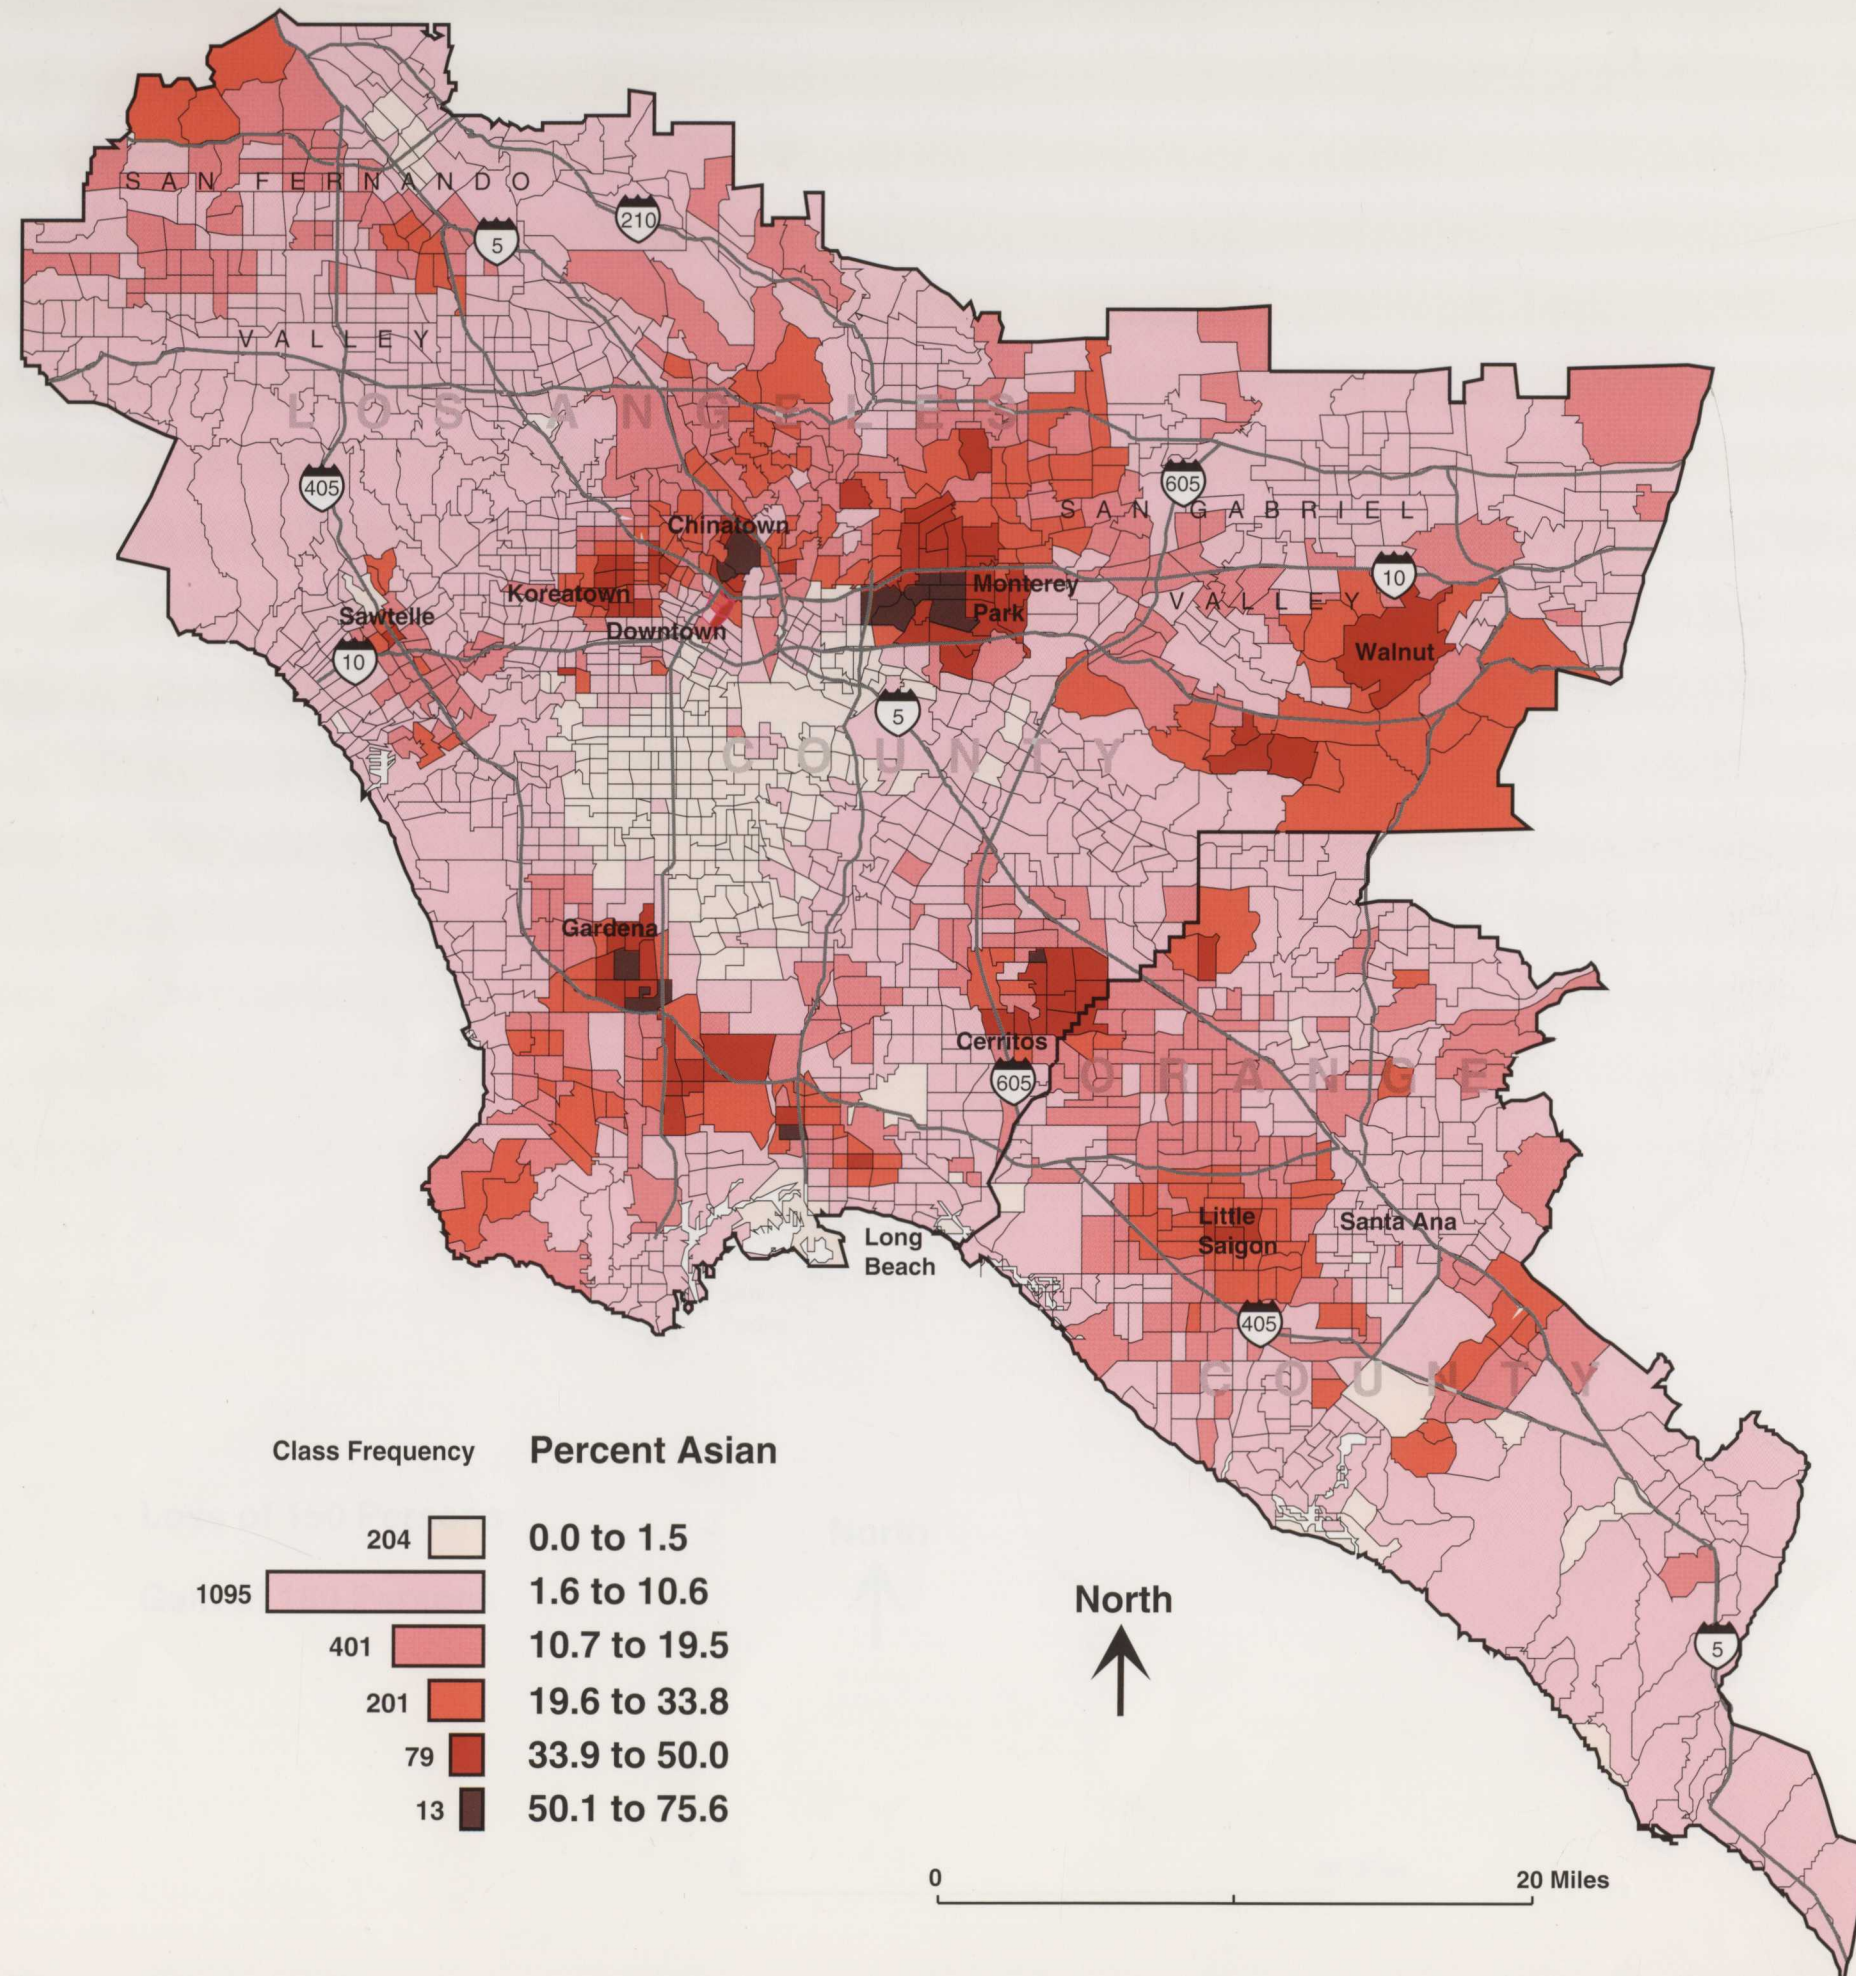

Metropolitan Los Angeles and Orange Counties
1990

Considering that Asians constitute less than 11 percent of the population in both Los Angeles and Orange counties, the number of tracts that are over one-third or one-half Asian is striking. Individual Asian and Pacific Island groups such as Japanese, Filipinos, Tongans, and Vietnamese have their own cultures, social networks, and chains of migration. Thus, it is not surprising that each group has its own distinctive settlement pattern.

Of the major suburban regions, the San Gabriel Valley has become the most intensely Asian. Monterey Park, with its 57 percent Asian population, has the highest percent of Asians of any city in the two counties. Nearby cities of Alhambra, San Gabriel, and Rosemead are about one-third Asian. Perhaps the greatest transformation is in the wealthy enclave of San Marino, which was 92 percent white in 1980 but is now 32 percent Asian.

Some Asians moved still farther eastward in the 1980s. The new suburban city of Walnut is now 37 percent Asian, and another major focus of settlement is Hacienda Heights, where the imposing Hsi Lai Buddhist Temple complex is located. The Asian population increased sharply in the Woodside Village section of West Covina, where many Filipino professionals were clustered in 1980.

Chinatown's residential area has expanded partly due to a Chinese influx from Vietnam. Two tracts here are over 70 percent Asian, the highest percentage in either county. To the west the predominantly Filipino Temple/Alvarado area is over-one-third Asian, as is Koreatown. In Long Beach the major Cambodian concentration is evident, as are the strongly Filipino tracts in West Long Beach. Most long-standing Japanese settlement clusters are still evident, such as in Sawtelle (West Los Angeles) and the Crenshaw area. Gardena, the largest Japanese concentration in southern California, increased its Asian percentage slightly, with two tracts now over 50 percent Asian. The major ethnic Vietnamese concentration is in Westminster in Orange County, where the area around Little Saigon on Bolsa Avenue is now 44 percent Asian.

Department of Geography
California State University, Northridge

Hispanic Population Change

Metropolitan Los Angeles and Orange Counties
1980 - 1990

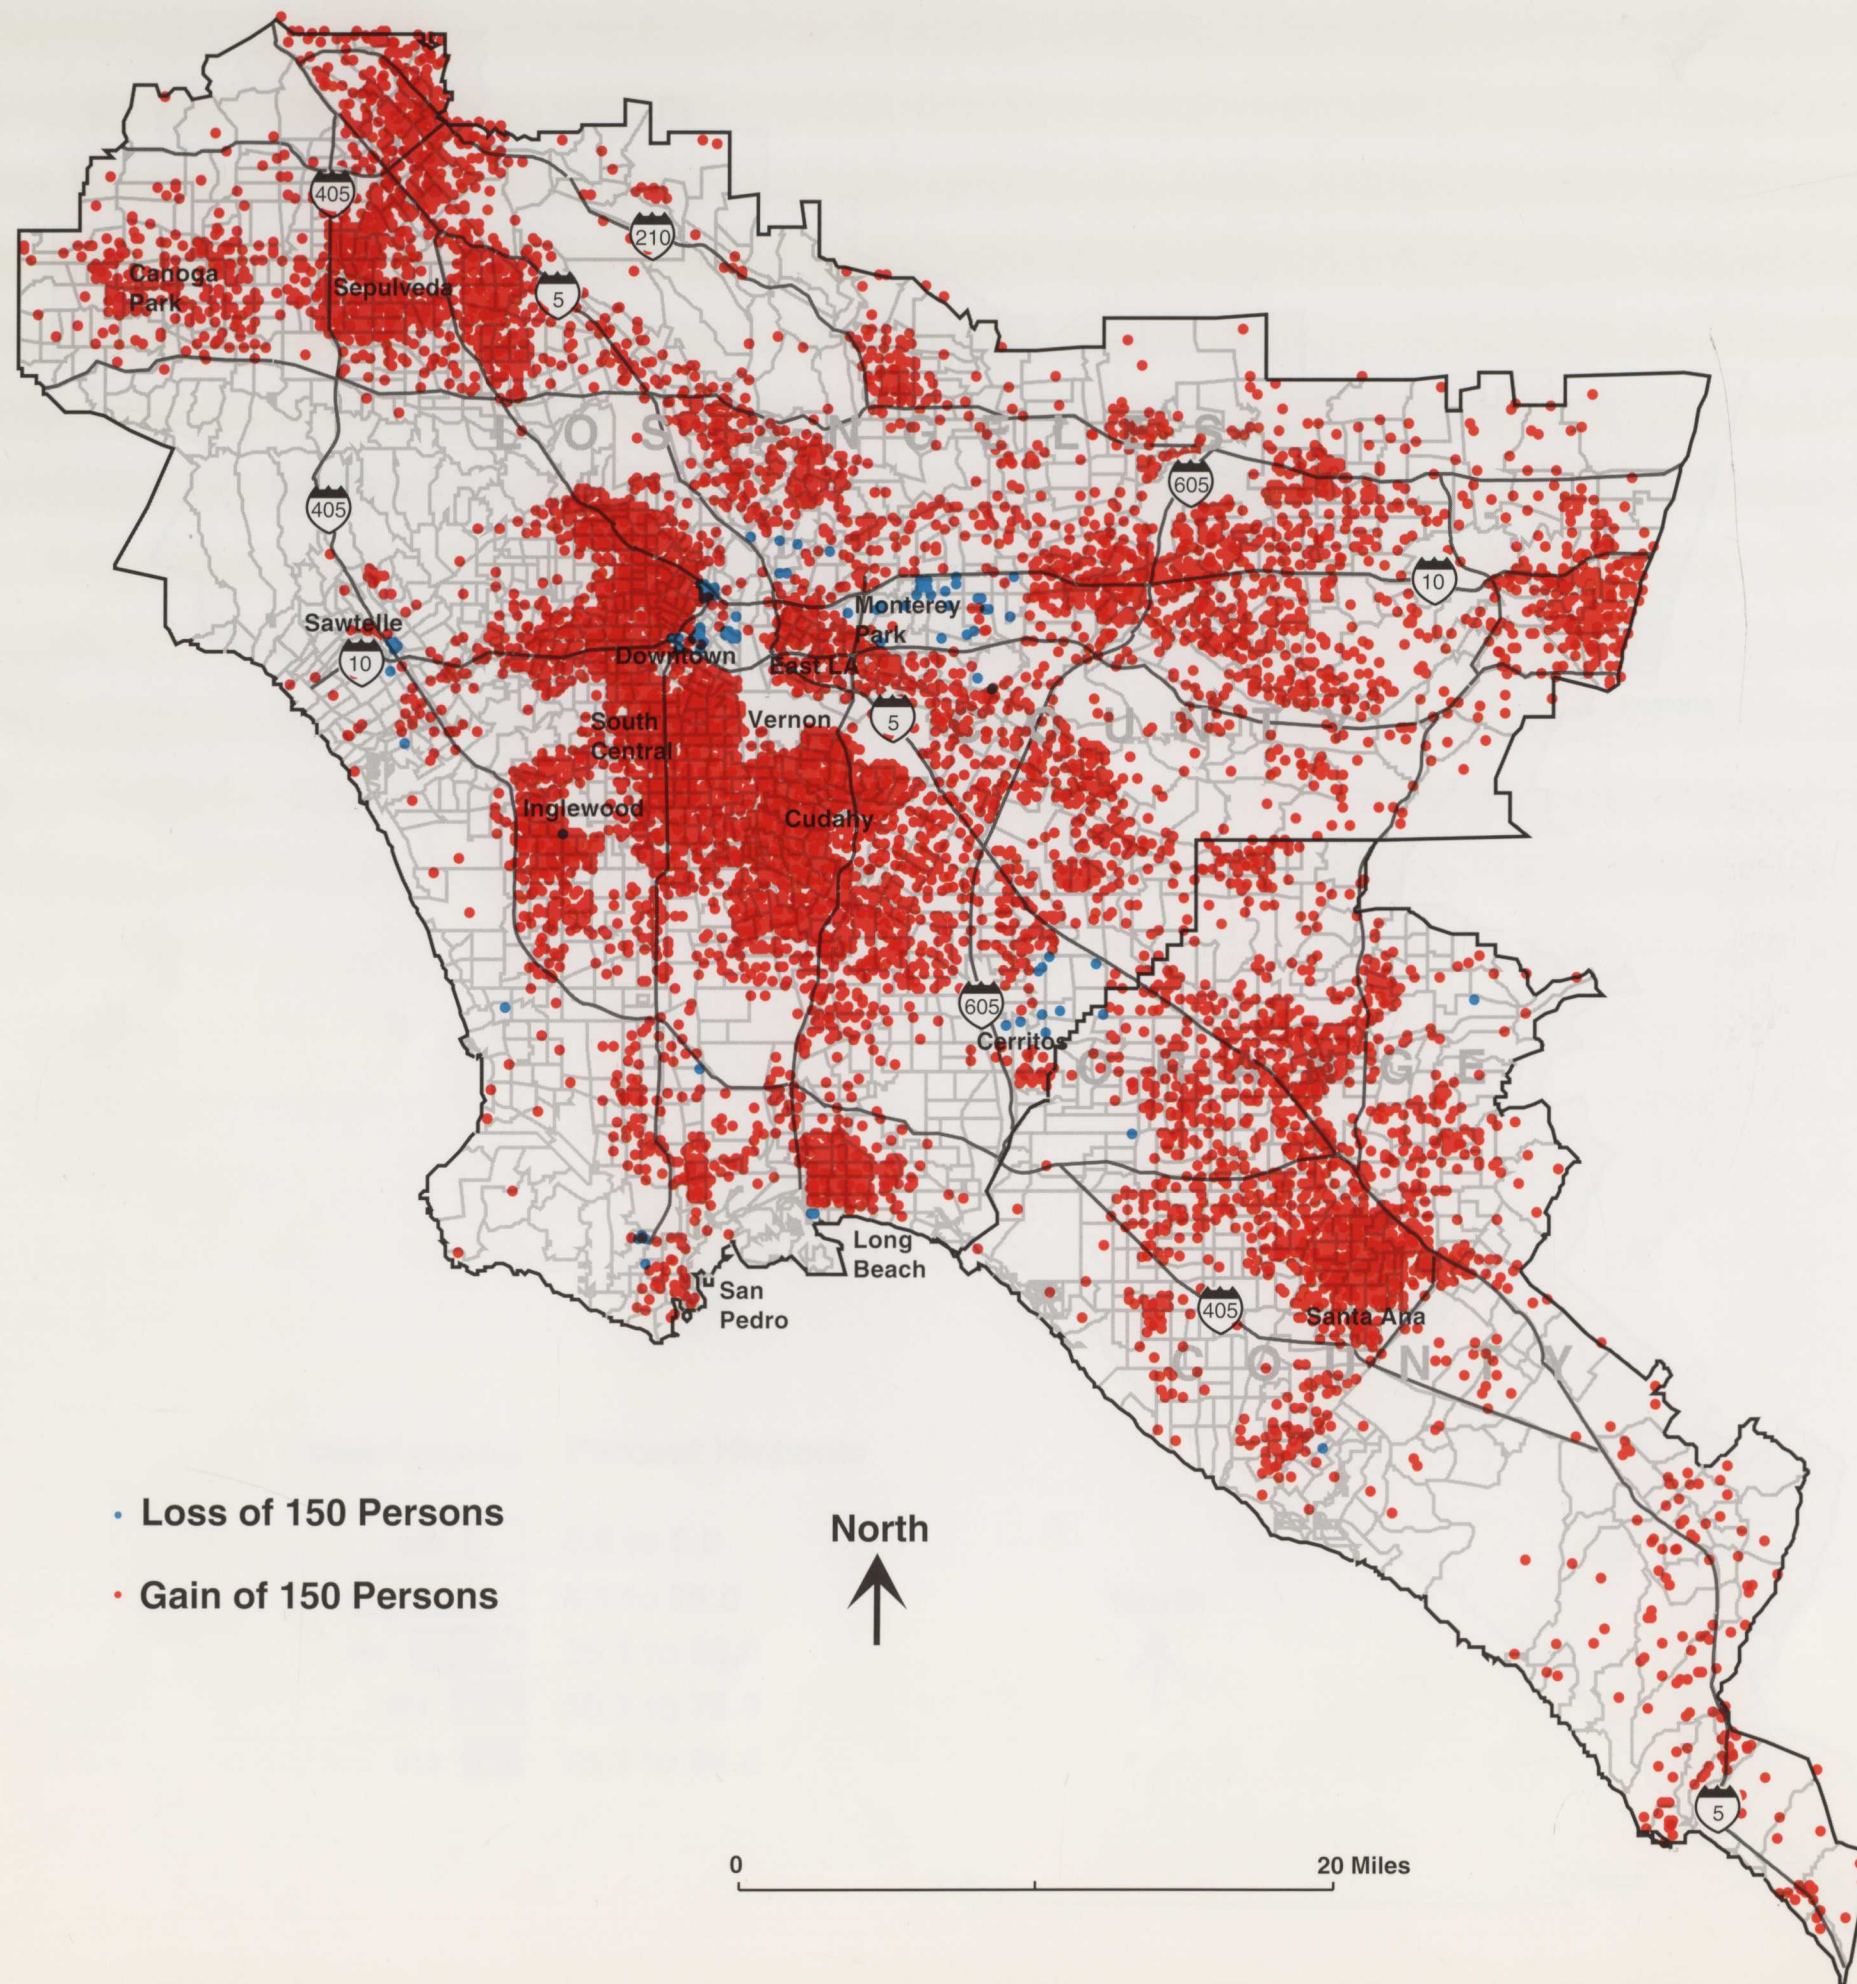

People of Hispanic origin are predominantly of Mexican, Central American, and other Spanish Latin American origins (Latinos). The most significant ethnic change over the last decade was the increase of over 1.5 million Latinos in Los Angeles and Orange counties. New arrivals, predominantly from Mexico and Central America, both legal immigrants and undocumented workers and their families, contributed to rapid population growth. Equally important, however, were the predominance of young adults and their high birth rate.

The traditional Mexican settlements of Boyle Heights and East Los Angeles took in more new residents, as did the Pico-Union area, just southwest of Downtown. A major development since 1970 was the settlement of thousands of poor Mexican and Central American immigrants in the industrial suburbs south of Vernon and the City of Commerce. By 1990 those five small cities were over 85 percent Latino, and Bell Gardens and Cudahy had the lowest per capita incomes of all the cities in L. A. County.

Latino in-movement in the 1980s was so strong that many people moved westward into South Central Los Angeles, often as far west as Vermont Avenue, renting or buying the homes of those blacks who left the ghetto. To the west of this area, many Latinos moved into Lennox and Inglewood, changing the latter city from 18 percent Hispanic in 1980 to 38 percent Hispanic in 1990. In Orange County, many Latino immigrants have settled in Santa Ana.

Latino declines were highly localized, sometimes the result of specific urban renewal projects such as new apartment construction. In some cases these same tracts showed a major increase in whites (tracts in Sawtelle and San Pedro) or Asians (a tract in Lincoln Heights). The Latino population just west across the Harbor Freeway from Downtown has declined because developers bought and then demolished many old houses as part of the planned Central City West renewal project. To the east in northern Monterey Park and adjacent Rosemead the arrival of several thousand Asians resulted in declining numbers of both whites and Hispanics.

Eugene Turner and James P. Allen
Department of Geography
California State University, Northridge

Percent Hispanic Population

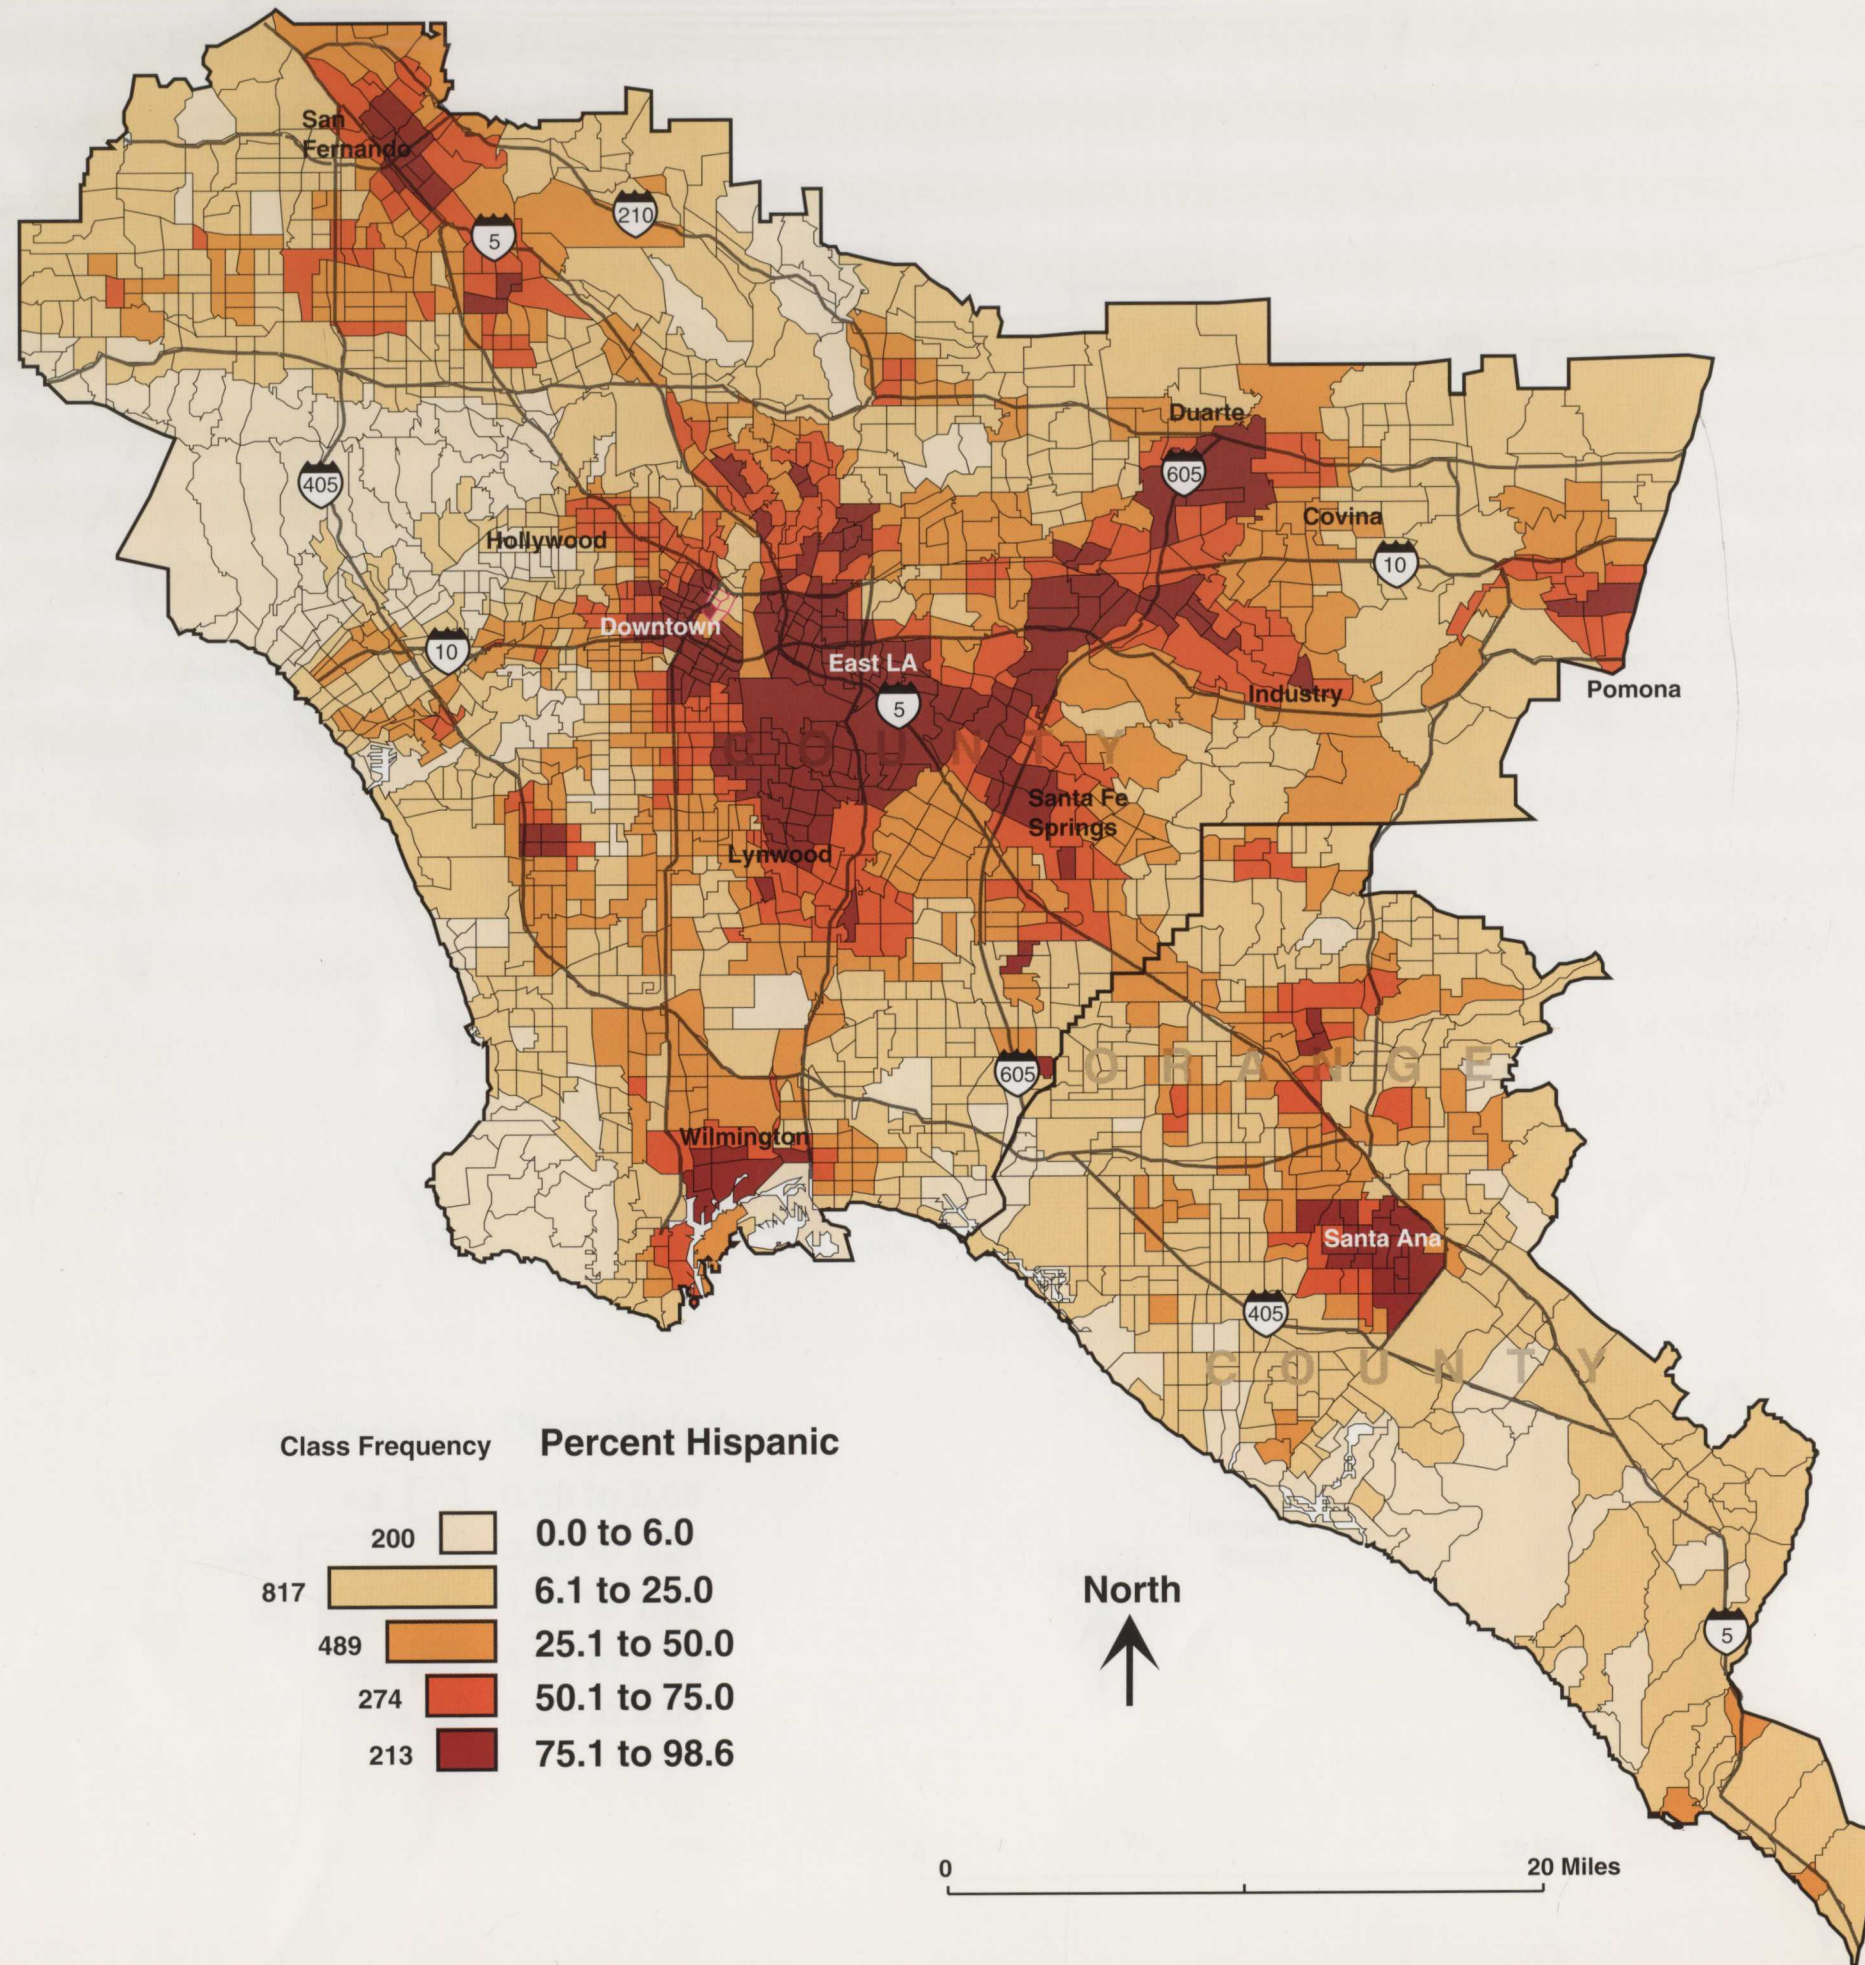

Metropolitan Los Angeles and Orange Counties
1990

The late 19th-century focus of Mexican occupance was near the historic city plaza just east of Downtown. Around World War I, development in that central area forced people of Mexican origin to start moving eastward into Boyle Heights and East Los Angeles, which evolved into one large barrio. Several tracts here have now become nearly 100 percent Hispanic. Inhabitants of the barrio have for decades tended to move farther eastward when they could afford to do so, resulting in a predominantly Mexican "Eastside". Montebello, Pico Rivera, Duarte, and Covina have become home to more affluent and suburbanized Mexican-Americans.

The historic and current importance of industrial employment for people of Mexican origin has resulted in corridors of settlement defined by railroad arteries. The most important ones trend southeast to Santa Fe Springs and eastward to the city of Industry. Another runs northwestward through Pacima and San Fernando. To the south of East Los Angeles, the arrival of Mexicans and Central Americans made the entire area on the east side of Alameda Street south to Lynwood over two-thirds Hispanic. In just twenty years Bell and Bell Gardens have changed from 16 percent to 86 percent Hispanic.

Elsewhere there are often sharp variations between tracts or small groups of tracts in the percentage of Latinos -- a striking mosaic usually reflecting social class differences. For instance, just southwest of Downtown is an immigrant reception area, especially for Central Americans. Many workers are employed on night-time cleaning crews in Downtown's high-rise office buildings, in furniture factories, and in garment industry sweatshops. This Latino area stops abruptly near the University of Southern California -- a focus for white residents in an area otherwise dominated by blacks. In the older parts of Hollywood, Latino residents are in the majority as far west as Highland Avenue but not in the adjacent hills and the Los Feliz section. Thus, ethnic and cultural boundaries cross the city in intricate, evolving patterns.

Department of Geography
California State University, Northridge

Ethnic Diversity

Metropolitan Los Angeles and Orange Counties
1990

This map shows the relative ethnic heterogeneity of tract populations as measured by the numbers reported in five groups: non-Hispanic whites, non-Hispanic blacks, Asians and Pacific Islanders, Hispanics, and American Indians (including Eskimos and Aleuts). An excellent statistical measure of diversity, the entropy index, was calculated for each tract.* Entropy index values increase as the groups become more equal in number within a tract. High diversity in a tract does not imply that the different populations are socially or residentially mixed within the tract.

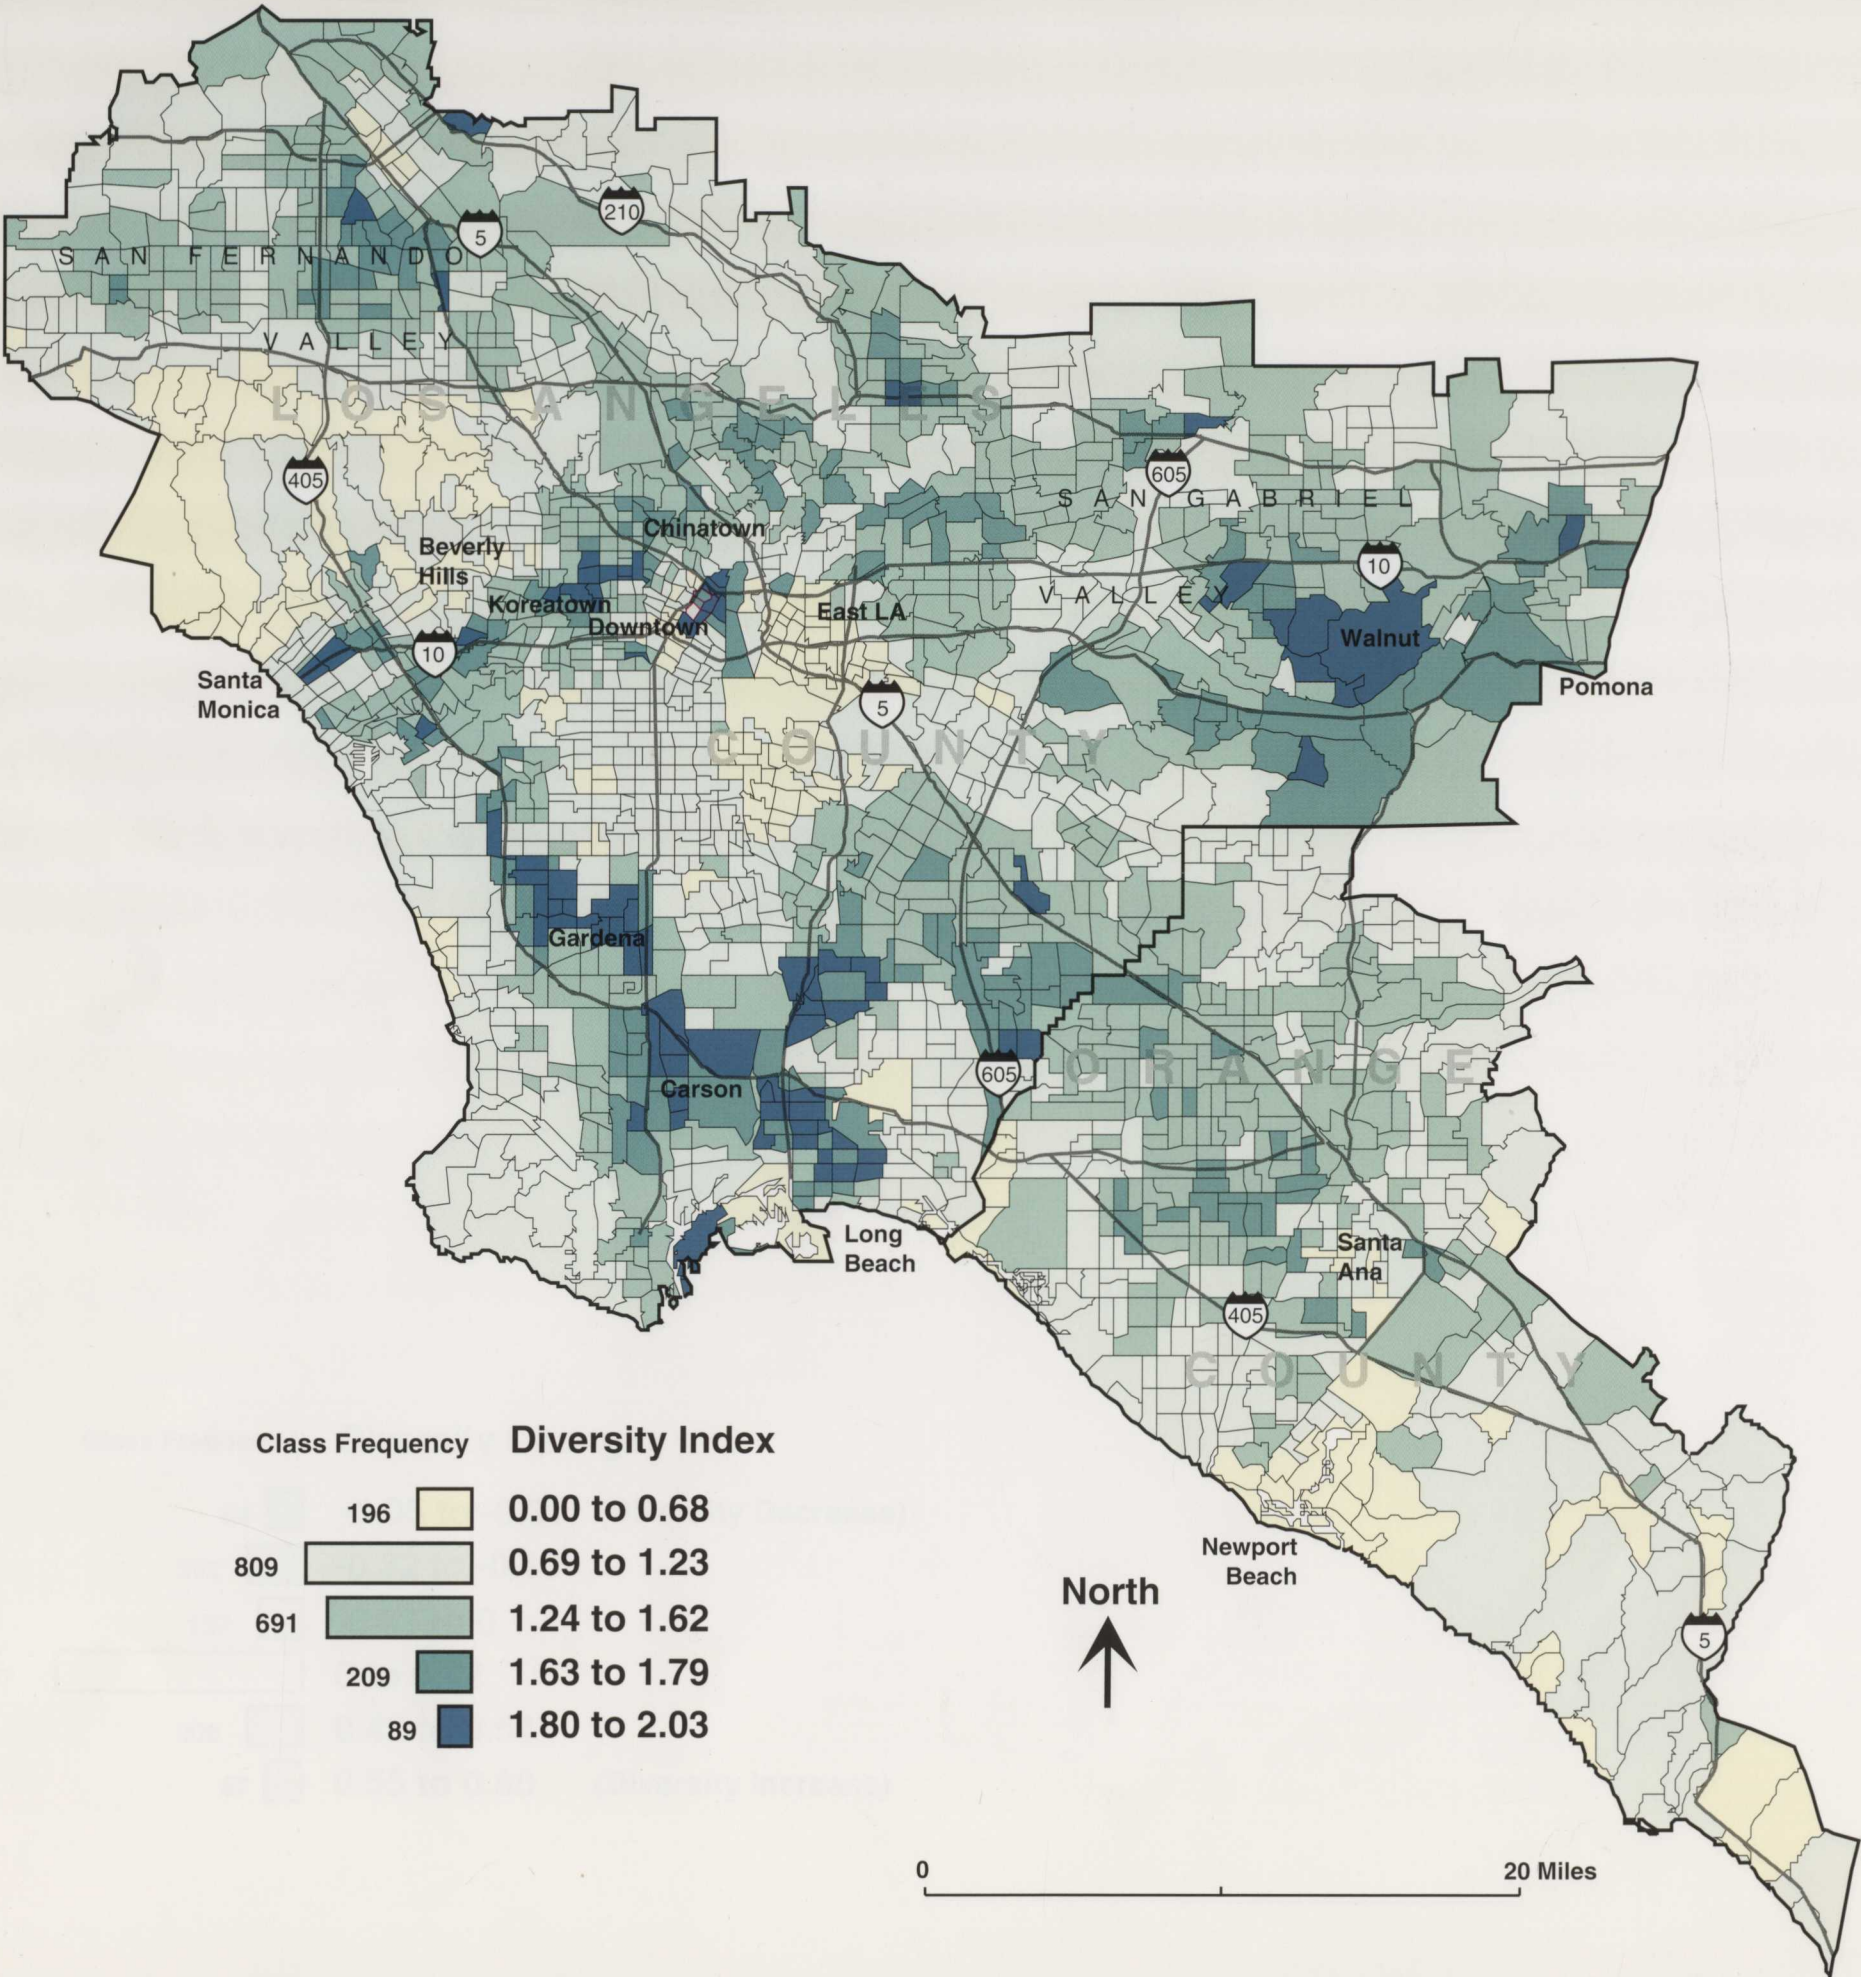

Los Angeles County as a whole is one of the most diverse counties in the entire United States. Greater ethnic diversity is often found in the meeting and mixing zones between different ethnic concentrations, as in Koreatown, which is only about 30 percent Asian. There, Latinos outnumber Asians in nearly all tracts, but both groups increased substantially during the 1980s as many white residents left. Another zone of unusually high diversity lies on the west side of the largest black concentration, from Hawthorne and Gardena southeast through Carson to Long Beach.

The map highlights some sharp local contrasts, usually closely related to differences in social class and housing costs. For instance, a central corridor of high diversity extends westward from Koreatown and Pico-Union, but to the north is very low diversity in the strongly white areas of Westwood and Beverly Hills.

Newer suburban areas of the eastern San Gabriel Valley and the Pomona-Walnut area are typically highly diverse in contrast to most other areas of new homes on the urban fringes because whites, Latinos, and Asians have so frequently chosen to move eastward. The lowest ethnic diversity is found in the most homogeneous ethnic areas, which can be either white, black, or Hispanic. Asians are generally dispersed with the exception of Chinatown.

*For a description of the entropy index and its properties see Michael J. White, "Segregation and Diversity Measures in Population Distribution", *Population Index*, v. 52, No. 2 (1986).

California State University, Northridge

Ethnic Diversity Change

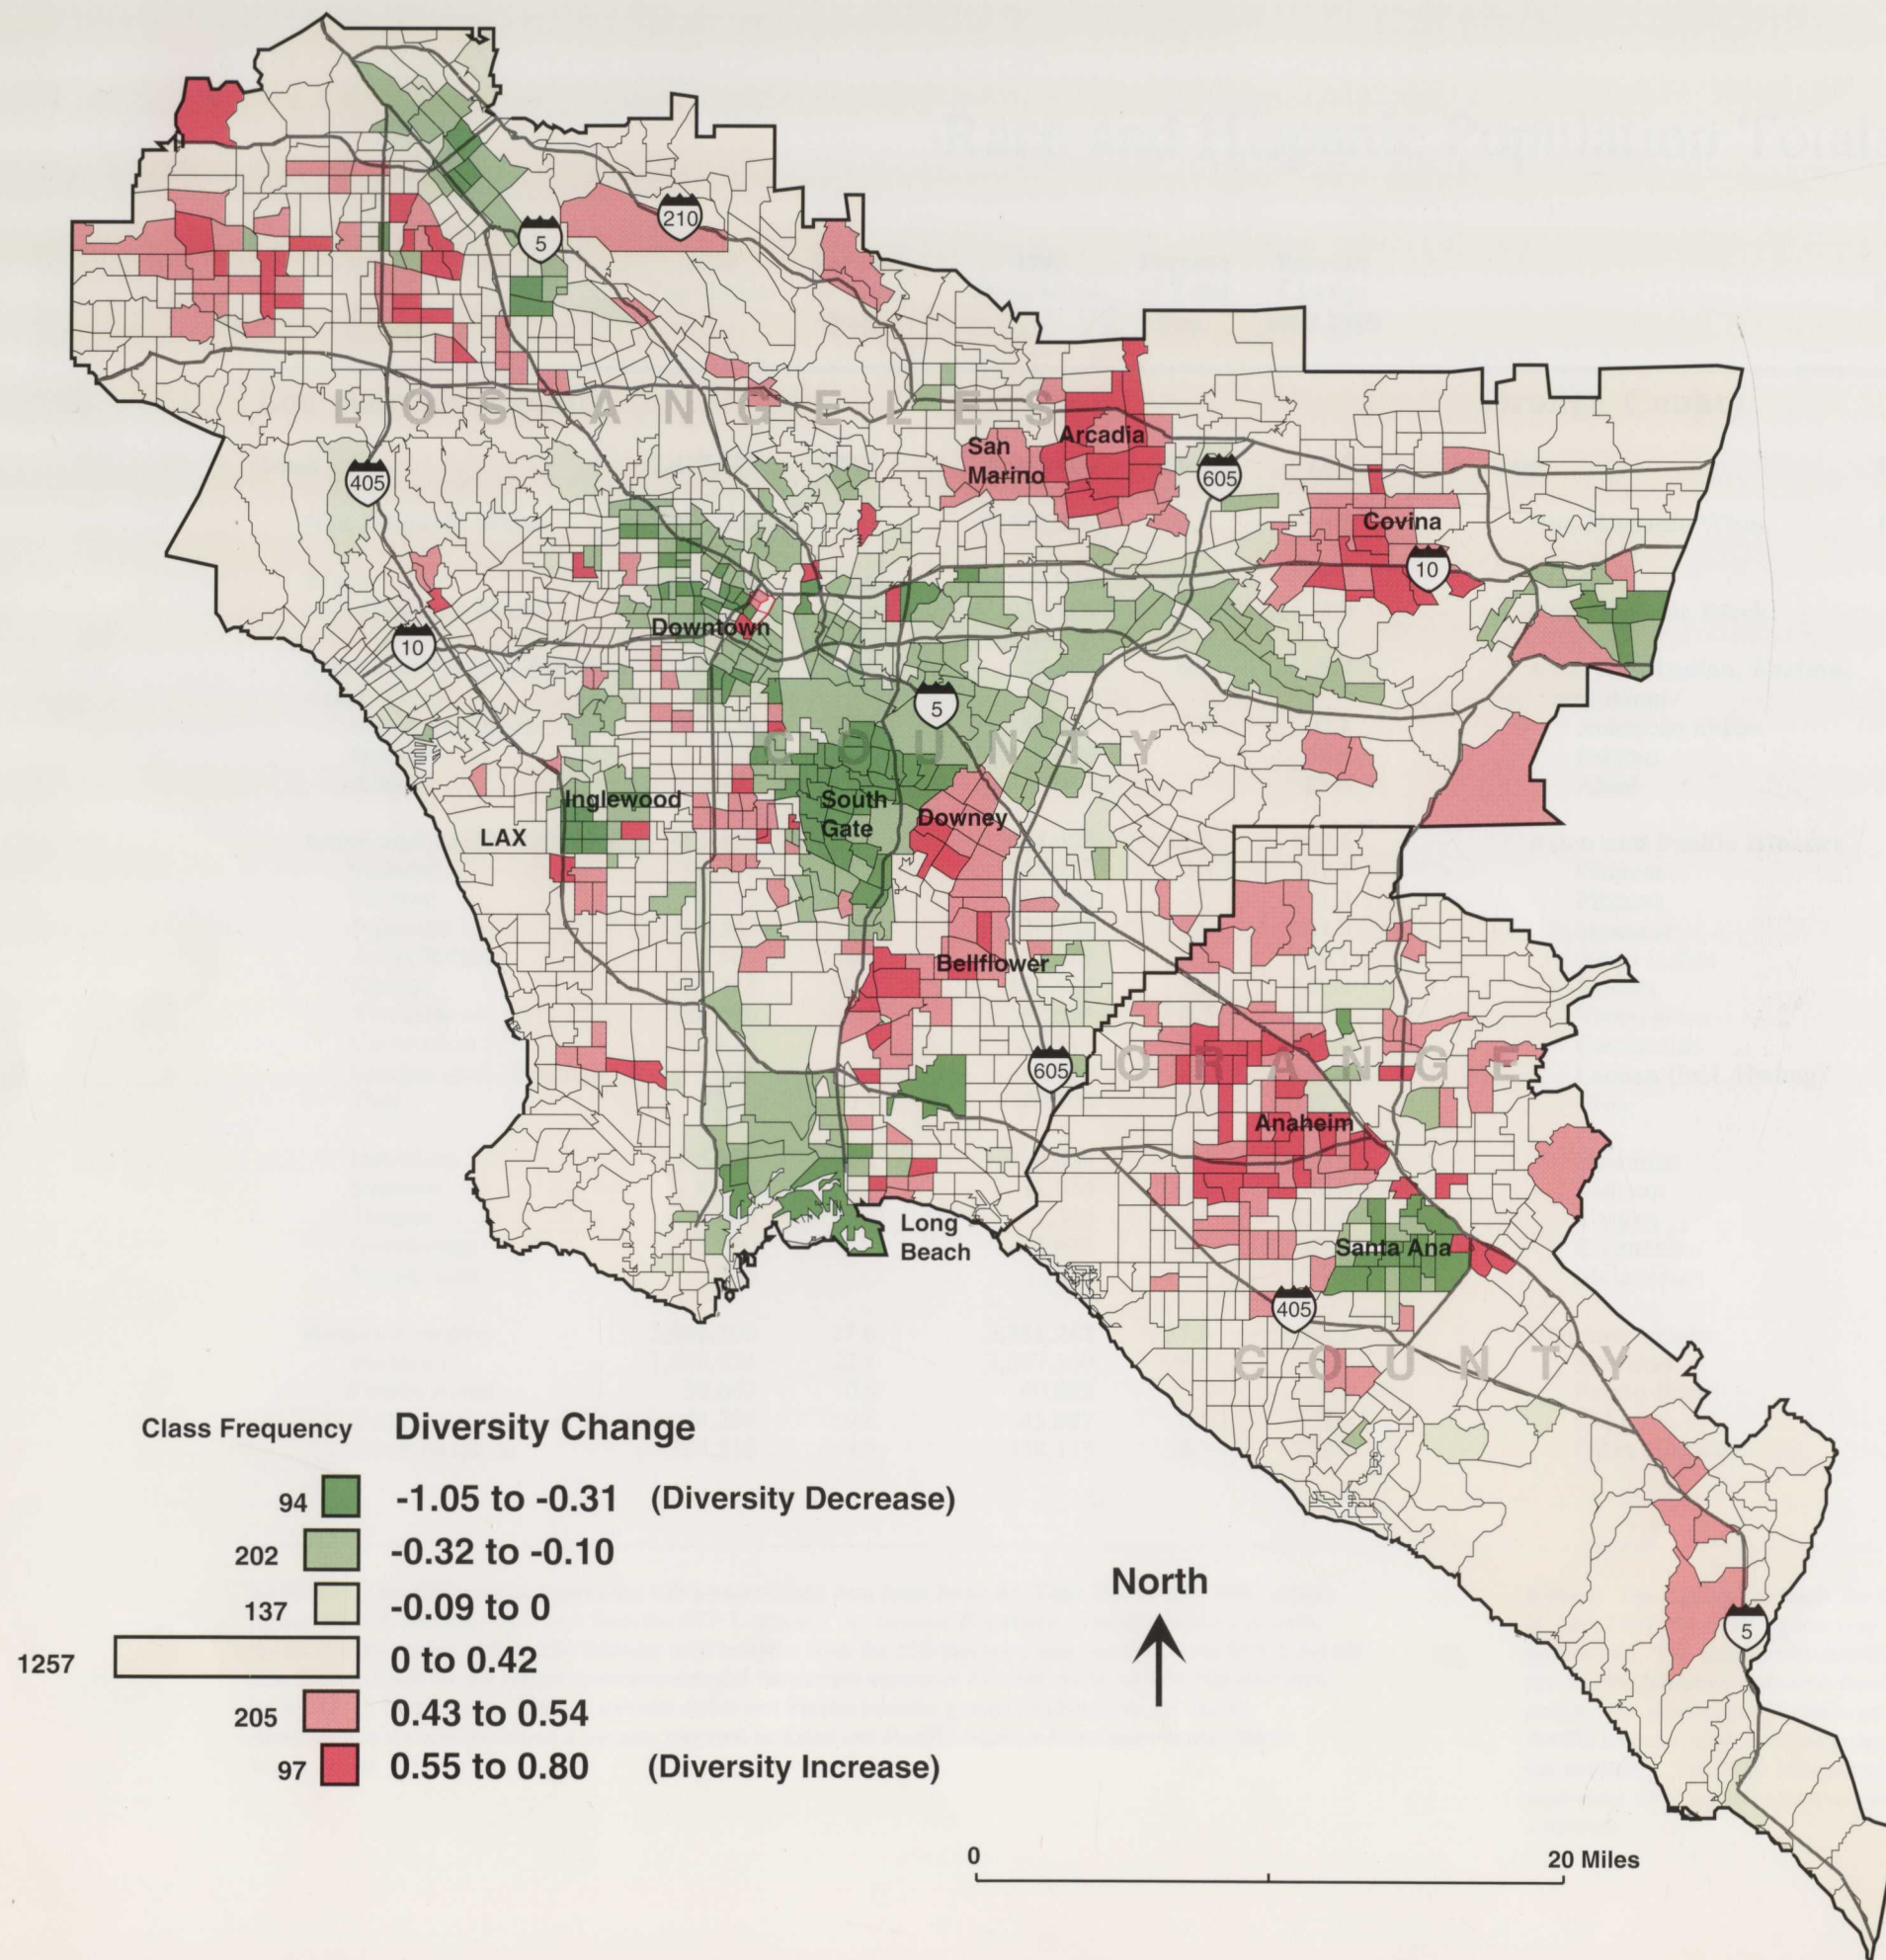

Metropolitan Los Angeles and Orange Counties
1980 - 1990

On the average both counties gained in diversity during the last decade, but this map identifies specific areas in which ethnic change during the 1980s has been most dramatic. Entropy indexes were calculated for all tracts for both 1980 and 1990. The 1980 values were subtracted from the 1990 values. Thus, tracts with much greater ethnic diversity in 1990 have larger positive scores, whereas tracts with decreasing diversity have higher negative scores.

In general, areas with large increases in diversity scores began to change ethnically in just the late 1970s or 1980s and have lost the greatest proportion of whites and gained the most minorities. Although this map identifies such areas of recent change, there are no simple explanations as to why such changes occurred during different decades in different areas.

The city of Downey, long a bastion of white settlement, lost thousands of whites during the 1980s while tripling its black population (to 3 percent in 1990) and evolving from 16 percent Hispanic to 32 percent. To the south, Bellflower and north Long Beach became much more diverse as they experienced the same sort of change. Higher-status Arcadia and wealthy San Marino had not been at all diverse in 1980, but so many Asians replaced departing whites that their diversity increased sharply. And eastward the next focus of greatly increased diversity during the eighties is Covina and West Covina where blacks, Asians, and Hispanics all moved in.

Areas with the major decreases in diversity are typically nearing the end of a period of major ethnic recomposition and are solidifying ethnically with a single minority predominating, usually Latinos. This has occurred in parts of Pomona, for instance. The largest area of rapidly decreasing diversity was between Vernon and South Gate, where only a few elderly whites remained in an increasingly homogeneous Latino area. In Orange County, Santa Ana became less diverse because both whites and blacks left while Latino growth numerically overwhelmed the Asian increase. However, many tracts in Anaheim and Garden Grove became more diverse as whites moved out and both Asians and Latinos moved in.

Sources: The 1990 census figures are 100-percent-count data from Summary Tape File 1. The 1980 census figures are 100-percent-count data from the STF 1 tape and the *General Population Characteristics* volumes, except that the Asian and Pacific Islander total includes both the 100-percent-count numbers from STF 1 for the nine groups listed on the census questionnaire and the sample estimates of other Asian and Pacific Islanders from STF 4. Numbers for 1980 of specific Asian and Pacific Islander groups not listed on the census questionnaire are also based on a sample, reported in *Asian and Pacific Islander Population in the United States: 1980*, PC80-2-1E.

Notes: The figures are totals for the entire counties, not just the metropolitan portions covered on the maps. In July, 1991, the 1990 figures may be adjusted by the Department of Commerce to correct for an estimated undercount. The numbers in identified groups do not add up to the total county population because some Asians and Pacific Islanders and some American Indians are also counted in the Hispanic-origin group and because some people who were not of Hispanic origin identified their race only as "Other". Furthermore, the Asian and Pacific Islander total includes persons of origins not listed above. Percentage values less than 0.05 percent are not indicated. The 1980 100-percent-count numbers in this table (from STF 1) differ by a small amount from equivalent 1980 sample-count numbers (from STF 4 and the *General Social and Economic Characteristics* volumes).

Court of Appeal:

Woman's Allegations Posted on YouTube Are Unprotected

Same Assertions, Contained in Court Papers, Do Not Give Rise to Liability, Opinion Says

By a METNEWS Staff Writer

The Sixth District Court of Appeal has held that while an anti-SLAPP motion was properly granted in connection with allegations a woman made about her brother in an action to have a domestic violence restraining order imposed on him, videos posted on YouTube, accessible by the public, containing those accusations are not protected speech.

Causes of action based on the YouTube postings were ordered reinstated in an unpublished opinion filed Friday. Justice Cynthia C. Lie authored it.

Defendant Sandra Copas had brought an action on Dec. 10, 2019, seeking a restraining order against her brother, Walter Eugene Neal Jr. On April 7, 2022, she uploaded two videos to YouTube, one titled, "HELP ME I'm SCARED" and the other labeled, "4/1/22 HELP I'm So Scared I'm Shaking."

Links to those initial videos were provided in her pleading. Subsequently, she uploaded four more videos to YouTube.

Sister's Declaration

Copas insisted in a March 1, 2024 declaration, in response to the brother's December 2023 action against her—as well as her husband, Bryan Copas—for defamation and other torts:

"I believed Video #1 and #2 were posted privately on YouTube, and I even stated as such in the pleading. I state, 'These videos are confidential. It is only to be used for the 4/21/22 hearing....'"

She said a third video was uploaded by her on Aug. 19, 2022, for use in a Sept. 1 hearing. Three more were posted to YouTube on Sept. 9, purportedly to assist the local police department.

"When I learned the public could access these YouTube videos," Copas said, "I immediately took the videos down."

Her action for a restraining order was dismissed by her prior to her brother bringing his action against her.

Motion Granted

Santa Clara Superior Court Judge Amber Rosen on June 27, 2024, granted the defendants' special motion to strike pursuant to the anti-SLAPP statute, Code of Civil Procedure §425.16, as to all causes of action. Lie's opinion reverses that order, instructing that, on remand, it be granted only as to claims not tied to the public posting of the videos.

The justice declared that Neal's claims stemming from the 2019 proceeding against him are based on protected activity—the first prong of §425.16—but fail to meet the test of the second prong: minimal merit. But, she said, the public posting of the videos is not protected.

Lie wrote:

"Defendants contend that the videos are protected as statements in connection with litigation or police reports. Not so. Defendants' theory overlooks the different audiences each publication of the videos targeted. That publication to the court or to law enforcement may have been protected in some contexts does not establish that all publication is protected or that the content of the videos enjoys absolute protection. Unprotected defamatory statements broadcast to the public at large do not acquire protection by the mere act of later publishing them to a court. To hold otherwise would seem to doom any defamation claim."

Public Interest Lacking

Lie went on to say:

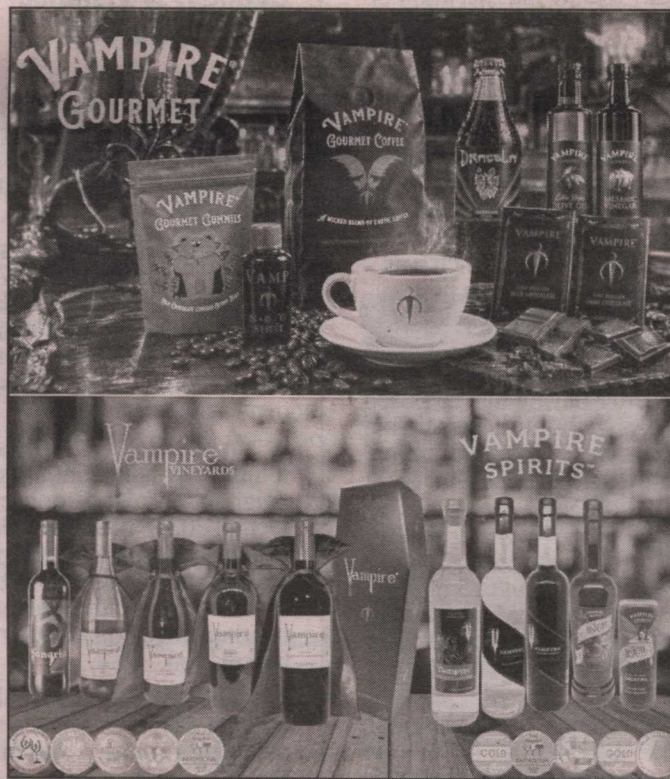

"We accept that defendants' transmission of the YouTube videos to the court or another person having some interest in the litigation is protected, but the posting of the videos to the general public on a public YouTube channel is not. Nor has there been any showing that the public has some interest in the litigation."

She said that while the "defendants may invoke Civil

Code section 47.1," the litigation privilege, "to defend this suit on the merits," it remains that "the litigation privilege and the anti-SLAPP statute are distinct" and the former "does not establish" the defendants' "entitlement to protection under Code of Civil Procedure section 425.16."

The case is *Walter N. v. Sandra C.*, H052459.

Owner of Gothic-Themed Trademarked Brands Claims Infringement by 'Vampire Punch'

The graphics above are exhibits to a trademark-infringement complaint filed yesterday in the U.S. District Court of the Central District of California. At left are products of the plaintiff; at right is a product alleged to be infringing.

By a METNEWS Staff Writer

A corporation headquartered in West Hollywood that makes and markets wine, chocolates, and other food products under the "Vampire," "Vampyre," and "Dracula" labels yesterday brought suit in the U.S. District Court for the Central District of California claiming that its trademarks are being infringed by a Sonoma County manufacturer of a syrup that it claims is wrongfully sold in California at Marshalls and HomeGoods stores.

Vampire Family Brands, LLC, brought its action under the Lanham Act against Crave, Inc. based on its production of "Vampire Punch," a sugar-free syrup, and against TJX Companies, Inc., owner of Marshalls of California, LLC, and HomeGoods, LLC. The complaint, drafted by West Hollywood attorney Michael Machat, says:

"Besides selling its products directly to consumers, Crave also sells its products, including the accused product to retail stores throughout the United States, including to Defendants TJX, HomeGoods and Marshalls of CA."

It alleges (with paragraph numbering omitted): "Defendants' accused product is intended for making cocktails."

"Plaintiff sells ready-to-drink cocktails, including its gold medal winning, 95-point rated Vampire Absinthe Cocktail...."

"Defendants continue to unlawfully promote, advertise, market and sell its infringing Vampire Punch from its website, and from retail brick and mortar stores."

The pleading adds that "[d]efendants' intentional wrongful acts are harming Plaintiffs brands' reputation and are diluting the brands and are disparaging" because consumers are apt to be confused into thinking that the plaintiff makes the punch syrup.

Prior to Vampire Brands moving its vineyard to California's Napa County, it operated out of Transylvania, Romania. Its operations expanded, including operating the Vampire Lounge & Tasting Room in Beverly Hills, now closed.

The case is *Vampire Family Brands, LLC v. Crave, Inc.*, 2:26-cv-10015.

MEDIA REPORT TO WOMEN

Covering all the issues concerning women and media

Volume 54, Number 3

Summer 2026

Young Biz Journalists Are Majority Female

The Reynolds Center for Business Journalism's most recent survey, released in June 2026, shows a positive trend in the pace of hiring and attractive numbers on the compensation side, with a large cohort of women in the younger corps of business journalists.

The vast majority of survey respondents (69.4%) stated their current position was as a reporter, correspondent, or freelancer, with 26.8% of respondents stating they are in editorial or managerial positions. The remaining respondents reported holding other roles, such as researcher, producer, or academic fellow. The median salary for all respondents this year was \$92,500, with editors, supervisors, and managers reporting a combined median salary of \$109,375. Very few respondents (2.1%) reported a decrease in salary in the last year, with the overwhelming majority (68.9%) reporting a salary increase. The remaining respondents stated their salary stayed the same (26%) or were too new to journalism (3%) to have had a change in their salary.

"The strong hiring and salary increases show that journalists with business expertise remain in high demand – and they continue to enjoy a healthy salary premium over other journalists," said Dr. Jeffrey Timmermans, director of the Reynolds Center.

Print and digital media outlets are still overwhelmingly where business journalists have found work, with 93.2% of survey respondents reporting from these outlets. The remaining business journalists have found positions in radio, podcast, TV, or wire service outlets.

Is Journalism Still Worth It? These J-Majors Are Both Hopeful and Concerned

The Student Press Report's Sydney McGarr conducted interviews with five aspiring journalists from around the U.S. to get answers to the question: Is journalism still a viable career choice? The contraction of jobs in local media, the unknown impact of AI, hostility of toward journalists – does it add up to likely career satisfaction and success?

In 2023, 10,073 students graduated with journalism degrees in the U.S., according to a report by Data USA. Here's a portion of what McGarr and her interviewees, all current or former student journalists, say about the profession:

"I didn't go into the field for money. I'm more so in it for the duty of serving my community and helping people get factual information." -- Hannah Neurohr, Pennsylvania State University graduate

"In all honesty, I am not very confident about getting a job, especially in sports journalism because I feel it's a high-demand, male-dominated field." -- Madison Lamb, Scottsdale Community College student

What's Not So Super About 'Supergirl'

Another iteration of "Supergirl" debuted in June at theaters nationwide, to mixed reviews, misogynistic critiques, and the misfortune of being in a film category — the superhero genre — that is experiencing declining audience interest.

Aviva Dove-Viebahn, an assistant professor of film and media studies at Arizona State University, has written a discerning essay for the Women's Media Center about "Supergirl", unpacking the features of the film that succeed and the opportunities missed.

"The film seems intent on threading the needle of audience appeal: Its characters can't be too feminine, too masculine, too feminist, or too explicit in their grief, rage, or pain," Dove-Viebahn writes. "It's not women-led films that are the problem, it's the culture of apprehension around accusations of being either overly feminist or not feminist enough that means, ultimately, no one gets to be happy."

The scarcity of women in roles that showcase agency, influence and power is slowly being improved in Hollywood. But with the action-hero genre, "with fewer women-led films comes a higher burden of representation, often leading to greater scrutiny of these films by audiences and critics," Dove-

Viebahn says. "While films like Wonder Woman (2017) and Captain Marvel (2019) were wildly successful, women-led superhero and action films are disproportionately plagued by confirmation bias, with narrative flaws or general audience dissatisfaction more likely to be attributed to the gender of the film's star."
